SATURDAY, JANUARY 27, 1912

☞The date on the label on your paper shows the time to which your subscription is paid.

THE lady teachers of New York City have won a great victory in their demand for equal pay with men. Why not?

IT is seldom you find a man in Kent who does not expect to attend the National Convention in Baltimore on June 25th next.

THE death of Mr. Charles A. Estes removes from our midst a familiar figure and an old-time politician. He lived to be a ripe old age and to be a useful citizen.

IT is with regret we announce the sudden death of our fellow editor, George R. Ash, of the Cecil Democrat. He was at present Auditor of the State and a man of unusual ability.

THE death of Mrs. Victor Hendrickson coming so shortly after the death of her husband makes it doubly sad and a host of friends sympathize with the family in this double affliction.

FORMER Governor Crothers comes out squarely for direct vote in Presidential primaries, taking his stand in the front rank of the Progressives. He realizes that this measure has the support of the Progressive element of both parties; that it is a just demand and one that cannot long be resisted. "Such a thing is bound to come," he says; "it is the trend of public sentiment."

AN effort is being made by Congressman Covington, backed by the people of Kent and especially Millington, to have a survey made of the river from Crumpton to Millington with a view to completing the work of making the river navigable. This effort is a worthy one and the NEWS joins heartily in encouraging its successful termination. The river is now navigable as far as Jones' landing within a half-mile of that thriving town of Millington so that the cost will not be very great. Previous to the accomplishment of this part of the work the railroad was charging 7 1-5 cents per bushel for grain whereas today the charge is only three cents per bushel saving to the farmers of the neighborhood at least $10,000 per year. If this good work is continued further saving to the farmers of Sudlersville, Millington and other points will be realized. It is hoped that our faithful Congressman can succeed in getting this work finished.

THE agitation for new school buildings in our community is most timely, and should interest every school patron. To provide the very best school facilities for our young people is a most important public work, but the very best results cannot possibly be obtained without sufficient houseroom. This, it has been clearly shown, is sadly lacking. The proposition to issue county bonds for the purpose will, of course, meet with some opposition, but if it is considered wise to issue bonds for public road purposes why not for school purposes? It is proposed that new buildings shall be erected that shall meet the needs of fifteen or even twenty years to come, and that the young people who enjoy the advantages that must surely follow, and who are to be the men and women of the future, should, at least, bear a part of the burden. However, we would advise a vote of the people on such expenditures.

THE NEW ASSESSMENT.

The County Commissioners for Kent, sitting as a Board of Control and Review, have reported the following result of their work, as published in the NEWS last week:

Districts.	Real.	Personal.
First	$1,098,928	$307,355 00
Second	1,789,862	287,769 00
Third	1,132,036	199,801 00
Fourth	1,402,470	332,795 00
Fifth	776,746	205,900 00
Sixth	798,409	172,732 00
Seventh	692,588	114,448 00
Total	$8,240,499	$1,620,390

The total basis of real and personal, as above noted, is $9,860,490, but there is to be added to this a few private securities and shares of stock of corporations as reported by the State Tax Commissioner. This total is an increase of $1,400,000 over the old assessment, which is made up of one million in real and personal property and $400,000 on railroad property, which, under the old assessment, was rated very low.

The old assessment was as follows:

Districts	Real and Personal.
First	$1,890,038 00
Second	1,790,598 00
Third	1,076,556 00
Fourth	1,488,894 00
Fifth	921,381 00
Sixth	859,857 00
Seventh	680,857 00
Total	$8,408,881 00

FOR SALE.

ONE GASOLINE BOAT 30 foot long; one 16 ft. bate is suitable for 2 or 3 horse power engine; all tools and stock for boat building and engine repairing. Will sell at interesting

TUBERCULOSIS

Post Mortem Appearances.

ARTICLE No. 3.

When the carcass of a cow affected with tuberculosis is opened, the disease may be found in any part of the body. Lumps (tubercles) may be present in the substance of an organ such as the lung or liver, or they may be growing on the surface. These lumps may be so small as to be scarcely noticeable, or they may be as large as the closed fist, or even larger. If one of the lumps is cut open, the inside is yellowish and grits on the knife like sand, or else is of a cheesy nature, soft and creamy or hard and dry.

The lung is a favorite place for tubercles, and should always be examined. Lymph glands are often the seat of tuberculous changes. When healthy a lmyph gland is a little rounded body, not much larger than a good sized bean, the largest only the size of one's thumb. They are found all through the body and when healthy are so small as to attract little attention. Tuberculosis may cause them to grow to an enormous size, sometimes as large a child's head. In this condition they are similar to the tuberculous lumps already described. Those lying between the lungs and in the throat are the most frequently affected. Tubercles may be found in any part of the body, glands, lungs, liver, bowels, kidneys, womb, udder and even bones. The muscles and skin are seldom affected.

The Tubercle Baccillus.

The germ of the disease, tubercle baccillus, is a tiny, slender rod shaped body. Several thousand of them placed end to end would be needed to measure an inch, so that they are quite invisible to the naked eye. A powerful microscope is needed to see them.

Once the bacillus has gained lodgment inside the body of an animal, it begins to grow and multiply. It gets longer and when full grown divides crosswise, making two out of one. Each of these goes through the same process, the two becomes four, the four eight, the eight sixteen and so on indefinitely.

This multiplication takes place quite rapidly when conditions are favorable, a few hours only being required for birth of each generation. Nature, however, does not permit this process to continue long without offering some resistance. The forces of the body are aroused to action and a battle begins between the tissues of the body and the army of the invaders.

The first line of defense is composed of the white cells of the blood which hurry to the scene of action and endeavor to destroy the invaders by eating them up. Sometimes they are successful and the bacilli are destroyed, the infection checked. Often they fail in their object and are themselves destroyed and the multiplication of the germs continues.

The second line of defense is found by the cells of the tissue invaded by the germs. These cells arrange themselves in a circle around the germs and try to form a living wall beween them and the rest of the body. This barrier gradually become thicker and thicker and forms a little hard lump or tubercle, from which the disease gets its name. If this wall is complete and successfully imprisons the bacilli, these gradually die and the disease in that particular spot is arrested.

Frequently, however, both these safeguards are overcome. The germs break through the barriers and are carried in the blood stream or lymph channels to other parts of the body. New points of attack are selected and the process begins again, but with less chance on the side of the animal. As the tubercles increase in number, the power of the body to grapple with them becomes less and less, and gradually the animal falls a prey to the disease.

The tubercle bacillus does not multiply outside the body of an animal. It can live for a long time in favorable surroundings, such as dark and dirty stables. Sunlight soon destroys it. Freezing does not hurt it, but it can only stand a moderate amount of heat; exposure to 149 degrees Fahrenheit for twenty minutes kills it. Protected by a layer of dried mucus, such as is coughed up from the lungs, it withstands drying, light and ordinary disinfectants, but is readily killed by steam or boiling water.

How The Disease Spreads.

Sooner or later the tuberculous cow begins to give off the germs of the disease. The germs escape by the mouth and nose, the bowels, in the milk and in discharges from the genital organs. When the germs are being given off in any of these ways, the disease is known as open tuberculosis.

Germs discharged from the mouth and nose are coughed up from the lungs and are sprayed over the food in front of the cow or are carried in the air for a time until they fall to the ground. Cows in adjoining stalls may take in these germs in the air they breathe or in the food they eat and so contract the disease.

Germs discharged from the bowels are mixed with the manure, and may infect cattle and hogs that are allowed to pick over the dump heap. The practice of having hogs and cattle together in the same yard is sure to result in the infection of the hogs, if any of the cattle are affected. The germs in the manure come from the matter that is coughed up and swallowed, and in some cases from tuberculosis in the bowels themselves. Manure containing tubercle germs may easily infect the milk. Particles of dry manure may fall into the milk pail from the skin of a dirty cow or be accidentally flicked off from the tail and fall into the milk. Straining the milk afterwards only removes the larger particles. The smaller ones including the germs remain in the milk. When the udder is tuberculous, the milk contains the germs in vast numbers. Such milk may look and taste perfectly good, but readily transmit the disease to young animals. It is very dangerous to children. Hogs and calves are very readily affected by it.

Tuberculosis may be introduced into a herd in a number of ways:

1st. By the purchase of a bull or other animal that is infected with the disease. This animal may be apparently healthy at the time of purchase but if it contains the germs, the disease may develop and spread to other cattle. New animals should only be bought from a herd that is known to be healthy.

2nd. By feeding calves from milk, buttermilk or whey that has come from tuberculous cows a farmer may have a healthy herd but if he brings home skim milk from a creamery and feeds it to his calves, he may give them the disease. Such milk should be rendered safe by boiling or pasteurizing it.

3rd. By showing cattle at Fairs and exhibitions where no proper care is taken to keep out diseased stock or to disinfect the stables.

4th. By shipping animals in cars that have not been disinfected, as these may

AGAINST OYSTER CULTURE.

D. Bachrach, of Baltimore, Writes a Strong Letter Against Monoply On The Face of The Waters.

There is no doubt that the present legislative session will witness the same persistent attempt that has been made at every session for years past, even after the Haman Oyster Planting and Leasing bill was enacted, to pass legislation that will be more acceptable to those who want to find some legal means to form a large monopoly of the Chesapeake Bay bottoms. We have an oyster-planting law amply sufficient for individual enterprise and thrift, but it will not admit of a big "merger" or "combine" to form one large corporation to monopolize the entire business.

To accomplish this end the "interests" that are behind this movement have been persistently educating public opinion, through the press and otherwise, in all parts of the State outside the tidewater counties (where they practically understand the question) and trying to array it against the people who are now making a hard-earned and honest living by the industry. Even as it is, the packing houses and commission men combined have succeeded in driving many people out of the business of taking oysters, and so aiding the attempt at monopoly of the entire industry.

In support of this contention, I will give some facts which are very little known outside the oyster-producing territory. For years there has been no scarcity of oysters, but there has been a scarcity of a market. Two years ago I traveled to Salisbury with several oystermen and planters who confirmed what I had incidentally learned previously. One of the gentlemen had 12,000 bushels of oysters ready to take up from the creek in which they were planted, but declined to do so because the packers offered only 30 cents a bushel at the wharves, and they were of splendid quality. Just think of it, 30 cents for the oysters in the shell which, when shucked and delivered to the consumer, cost him not less than $1 20 or more! Where does that difference go?

But just recently Mr. C. L. Miller, elected to the House of Delegates from Kent county, informed me, and was supported in his statement by Mr. W. H. Hadaway, a well-known resident or Rock Hall, that 17 cents a bushel was all that was offered for oysters in the nearest harbor of that locality by the packers and commission men, and one time as low as 13 cents a bushel was paid!

In view of these facts, which seem to be confirmed on every hand, why this persistent movement toward monopoly legislation? Would those constituting a monopoly sell oysters for less? Can they feed oysters (?) any cheaper than nature now does? Would they be likely to give the public the benefit of "economies of production" so much prated of by the trusts, or would they, like their prototypes, put the savings in their own pockets and let the public be ——

Would the honest longer be benefited by allowing the monopolistic planters to scrape the natural bottoms clean of small oysters to replenish their beds, and so leave nothing for him to gather, which would undoubtedly take place? Let the people ponder over these questions before forever parting with their patrimony just as the Government is now doing in Alaska, before parting with the mineral wealth of that Territory to the Guggenheim-Morgan monopoly. Is it not possible that this State can use the same means to replenish and keep alive the natural oyster bottoms of the bay that the monoply would use?

Is it not a fact, and I believe Professor Brooks has stated it, that if the shells of the oysters used up by the packers were returned to the bottom of the bay and dredging restricted to certain localities in stated periods, and a little intelligence used in the matter of open and closed seasons, the bottom of the bay would in a very few years contain more oysters than have ever been there and leave a plentiful field for all who are industrious enough to gather them?

Of course, this would leave an open field, no favors and plenty of oysters, as was the case 30 and 40 years ago, and we would be deprived of the privilege of having a few gentlemen own it all and hire the oystermen at starvation wages, plus free libraries and public charities, to support the victims created by monopoly of the people's property.

WANTED.

Reliable party to handle our Tea and Coffee wagon in Chestertown and vicinity, good inducement forga live man to start the work. Apply at once.

Messiah's Kingdom Nearing.

The period in which sin is permitted has been a dark night to humanity, never to be forgotten; but the glorious day of righteousness and divine favor, to be ushered in by Messiah. He as the SUN OF RIGHTEOUSNESS, shall arise and shine fully and clearly into and upon all, bringing healing and blessing, will more than counterbalance the dreadful night of weeping, sighing, pain, sickness and death, in which the groaning creation has been so long. "Weeping may endure for a night but joy cometh in the MORNING."

For further LIGHT on the coming Kingdom send thirty-five cents for the Helping Hand for Bible Students, entitled, "THY KINGDOM COME."

Public Sale

On Saturday, Feb. 17, '12

At 10 30 O'clock A. M.

We will offer at Public Sale

22 HEAD

of Thoroughbred Registered

HOLSTEIN

Bull and Heifer Calves.

Also 2 Registered Cows in Calf

Five of these Bull Calves are now ready for service. This is the finest crop of calves that we have ever raised—some mostly white, others evenly marked.

SIRE, is San Jose Pontiac Korndyke Wayne, No. 62,953. He is backed on both sire's and dam's side by A. R. O. records for four generations.

He twice traces on sire's side, as grandson and great grandson, to Hengerveld DeKol, No. 23,102, A. R. O., up to date still recognized as the grandest Bull of the breed, with 115 Advanced Registry Official daughters and 36 proven sons, among which is the sire of our bull, Pontiac Zelos, 41,479 A. R.

His dam is of the Kol DeKol's Butter Boy strain on sire's side and Belle Korndyke, A. R. O. on dam's side, the foundation of the Pontiac Korndyke strain, now attracting the attention of Holstein breeders.

The calves on dam's side are all out of daughters of sons and grandsons of the grand old bull, Paul Beets De Kol, No. 22,255, A. R. S., with 99 A. R. O. daughters and 27 proven sons.

This is the first crop of calves with such fine blood to be offered in this section.

Remember, that you bull is half your herd. Don't fail to get a a good one. Our herd is ANNUALLY TUBERCULIN TESTED.

We will also offer some Registered and Unregistered THOROUGHBRED
