THE PEOPLE'S BANK

CHESTERTOWN, MD.

IF you are a business man, if you are a professional man, if you are employed at a daily wage, make up your mind to deposit weekly a certain sum of money in the bank. You'll be surprised how the sum will grow. Cash in bank gingers up the man who has it there. He has more confidence in himself. The business man is ready for a dull season. He is ready for an opportunity.

So is the professional man. The man who is working for a daily wage and who hasn't any money in bank frequently is fearful of a loss of his situation. He does not work as well or with the confidence in himself as does the man with something laid aside for a rainy day.

BUILD UP YOUR BANK ACCOUNT.

THE PEOPLE'S BANK—The Bank that led the way in paying 4 per cent on Savings Accounts

Find The Number First

Be sure of the right telephone number before taking the receiver off the hook. When you take off the receiver and say, "Wait a minute, central, I'll get the number," it causes delay on your call and a slowing up of the service in general.

Do not rely on memory, pencil notes or memoranda for telephone numbers. The telephone directory is always convenient and the best way is to look up the number. If the person you want cannot be found there, ask "Information."

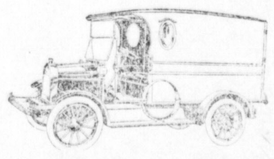
Coöperation Quickens Telephone Service.

THE CHESAPEAKE AND POTOMAC TELEPHONE COMPANY

R. C. HARRIS, Agent

Tel. 9000 Spring Ave., Chestertown

$725 Complete F. O. B. Phila.



Mr. Watson, like thousands of othre merchants, is saving moremoney by using a VIM. He writes in part as follows:

"Gentlemen:—I formerly employed a number of horses and wagons, but I am now making my deliveries with one VIM Truck. I should say it will easily do the work of two horse and wagon outfits, and costs about the same as one horse and wagon.
THOMAS WATSON, 324 N. 13th Street.

Mr. Watson is covering more territory, making more sales, developing more new business because he has a VIM.
He has a graceful, "classy" car that is advertising his business.
He has a sturdy, durable, economical car that stands hard work.
And besides he is saving real money. You can do the same.

Made in Phila. by Vim Motor Truck Co.
Broad and Huntingdon Sts.—Phone Diamond 60.

VALUE OF LIME FOR FARMING

IS EXCELLENT FOR CORRECTING ACIDITY IN THE SOIL.

SOME SIMPLE PRECAUTIONS

With the Aid of the County Demonstration Agent Farmers Can Test Their Soil.

College Park, March 15.—In a bulletin recently issued by the Extension Service, the writer, L. B. Broughton, treats the subject of lime for farming very thoroughly. A complete copy of this bulletin can be obtained by writing to the Extension Service, College Park, Md. Mr. Broughton, in the bulletin, says in part:

"One of the principal and in fact the most important factor that lime plays in increasing crop production is in neutralizing the soil acidity. In the majority of cases the acids of the soil are organic acids produced by the rotting of vegetable matter in the soil; yet other material and conditions may also cause a soil to be acid. Dissolved phosphate or rock in very large quantites may cause soil acidity particularly on light sandy soil. Sulphate of ammonia and muriate of potash also help to make a soil acid, so also does the natural decay of soils and rocks containing but little lime.

How To Determine What Soils Need Liming.

"The most accurate method for the farmer to determine if his soils need lime is by the litmus paper test. This test has been used for a number of years and is the best simple test that can be recommended at the present time. Litmus paper, both red and blue colored, can be obtained at any drug store for about 10 cents per package. Its value as an indicator depends on the great sensitiveness of litmus towards acids and alkalies, the blue being changed to red by an acid and the red paper being changed to blue by an alkali.

"There are a few simple precautions in the testing of a soil. A good method of procedure is as follows: Prepare two or three cups or deep saucers and a spoon by rinsing each carefully in pure rain water. Place a few spoonfuls of the soil to be tested in a cup, add a little of the pure water until a thin paste is made with the soil, dip an unused strip of blue litmus into the paste, being careful not to touch with the fingers the part of the strip dipped into the paste, allow it to remain in contact with the mixture for ten minutes, then remove and rinse off the soil particles in another cup of the pure water. If the soil be not in special need of lime, no change can be detected in the color of the litmus, in which event the test may be repeated, using red litmus, which if turned even slightly blue indicates an alkaline condition of the soil, and hence no need of liming. If the blue litmus be changed to a distinct red, the lime requirement is high, but even a faint reddening indicates a low content of carbonate of lime, so that liming is apt to be profitable.

"The use of fresh and well prepared litmus paper and either pure rain or distilled water are of prime importance. Old and faded litmus paper should not be used. Several samples should be tested both from different parts of the same field and from different fields, having as widely different soils as possible."

TREATING POTATOES FOR SCAB.

College Park, March 5.—In an article issued for the County Demonstration Agents for use in the local Boys' Agricultural Clubs in the State, S. B. Shaw, Specialist in Horticultural Extension, says: "Diseased potatoes may usually be recognized by their appearance. Tubers infected with Late Blight have a reddish brown surface color which extends towards the center of the potato. Slightly sunken, dark-colored spots on the skin are also an indication of this disease Planting clean seed and the summer spraying of the growing plants is the best means for controlling this trouble.

"Scab is recognized as a rough pitting of the potatoes. Sometimes these pits are deep, and in very severe cases the potatoes are furrowed or cracked. Seed may be disinfected by soaking the uncut potatoes in a solution of one pint of formaldehyde to thirty gallons of water for two hours. This treatment may be applied sometime previous to planting, provided the potatoes are not exposed to reinfection by being put into bags, buckets or other receptacles that have previously held scabby potatoes and which have not been disinfected.

"Rosette, stem rot or little potato, may be recognized by the irregularly shaped, elevated, dark brown patches of fungus threads, varying in size from a pin head to a grain of wheat, which appear on the surface of the potato. They are seen clearly only when the potato is wet. Only clean seed should be used. If there is any doubt as to the freedom of the seed from the disease, it should be treated as is recommended for scab.

"The presence of Wilt or fusariose, is detected by cutting a thin slice across the stem end of the potato and noting if there is a brown discoloration. Potatoes showing such discoloration should be discarded for seed.

NOTICE TO CREDITORS.

Notice is hereby given that the subscriber has obtained from the Orphans' Court of Kent county letters testamentary on the estate in Kent county, Maryland, of

JAMES W. SCOTT.

late of Kent county, Maryland, deceased.

All persons having claims against deceased are hereby warned to exhibit the same with the proper vouchers thereof to the undersigned on or before the 10th day of September, 1917 otherwise they may be excluded by law from all benefits of said estate. All indebted to said estate are requested to make immediate payment to the subscriber

Given under my hand and seal this 6th day to March 1917.

Sells It For Less and Pays More For Produce

Time To Think It Over

¶ This is an era of ascending costs—a period of price advancement without parallel. No statistical chart is needed to prove this. The effect of higher prices is felt by every one and is of real concern to all. It is a time for thoroughly weighing values—a time for taking advantage of every opportunity that offers a genuine saving. We have long been the greatest undersellers in the county.
