Your Fertilizer Man Recommends These Better-balanced, High-Potash Mixtures

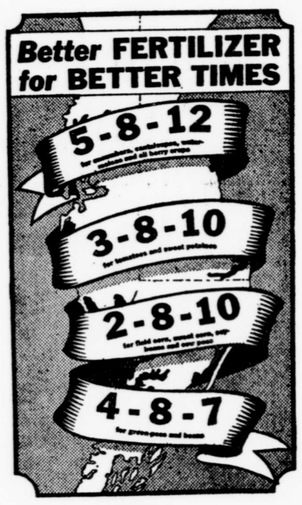
2-8-10 is not only the best fertilizer for both field corn and sweet corn. It is also the mixture to use for soybeans and cow peas. It produces higher yields of hay through increased top growth. It also produces higher yields of better quality seed.

5-8-12 keeps vine crops thrifty over a long period, producing cucumbers, cantaloupes and watermelons with firm meat of fine flavor. It is also the best fertilizer for berries, producing red, firm berries of excellent flavor and better size with less culls.

3-8-10 is the fertilizer to use for tomatoes if you want vigorous, healthy plants that produce the smooth, firm, high-quality tomatoes that are prized on all markets. 3-8-10 is also the best mixture for sweet potatoes, producing bigger yields of smooth, chunky No. 1's.

4-8-7 is a fine fertilizer for peas and beans. It produces sweet, tender peas and well-filled, crisp beans with plenty of "snap."

Plan now to use these better fertilizers for your crops this season. They are developed especially for Delmarva conditions. They are based on years of experiment and the experience of leading farmers. Your fertilizer man recommends them.



CORN is a very important crop on the Peninsula with about 400,000 acres devoted to its production. Yet many farmers do not consider corn a cash crop and neglect to fertilize it properly. They do not realize that the leak caused by a low corn yield often endangers their total profits.

It is a serious mistake to be content with low corn yields because: (1) it takes too many acres to grow the required amount; (2) corn makes heavy demands on labor when other crops, bringing higher returns, require the most attention.

Liberal application of 2-8-10 fertilizer will help Delmarva farmers to produce the corn they need on half the acreage now employed. Thus, the labor of cultivating corn can be cut in half, releasing labor and acreage for other important farming operations.

If you apply manure to your land or grow a legume in your rotation, use 400 pounds of 2-8-10 fertilizer per acre broadcast before planting. If you apply your fertilizer in the row or hill use 200 pounds of 2-8-10 per acre.

(Without manure or legumes you may need more nitrogen.)

This corn fertilized at a cost of $14.50 per acre made over 100 bushels per acre.

2-8-10 gives corn plants an early, rapid growth ahead of the weeds, making possible earlier cultivation. It produces vigorous, healthy plants with greater disease and insect resistance . . . maturity before frost . . erect stalks at wheat seeding and husking time . . and bigger yields of better quality, higher-feed-value corn. It reduces chaffiness and helps to control root rot.

2-8-10 produces a larger percentage of marketable ears of sweet corn. It fills ears out to the tip with plump, tender grains. 2-8-10 makes sweet corn sweeter, aiding in the formation of starch and sugar. For either field corn or sweet corn, it pays to use 2-8-10 FERTILIZER. Your fertilizer man recommends it.

When you buy potash in mixed fertilizer or straight potash, it pays to make sure you get genuine NV POTASH *—the same potash that has helped American farmers to produce better yields and better quality for fifty years.*
