JUDGE'S CAR UPSETS.

Mrs. Covington, Three Children and Chauffeur Have Narrow Escape on College Hill.

Chief Judge J. Harry Covington's car while en route from Washington to his summer home at Easton on Saturday afternoon met with an accident on Washington avenue, by which the machine was turned over and the Judge's family upset into the road.

Mrs. Covington says she had cautioned her chauffeur to drive carefully after the storm through which they had passed, as they had no chains on the tires, and this caution saved their lives. They had left the macadam road and were coming down College Hill when a team, driven on the wrong side of the road, was encountered.

The emergency brake was applied and the big Cadillac skidded, striking a bank and causing the car to turn over.

Judge Covington's wife, children and the chauffeur all crawled out unharmed.

A big game of ball had been in progress on the college grounds, and the accident drew a large crowd.

Bystanders assisted the family and many helped under the direction of Mr. Wm. C. Sutton to right the car, and at 7 o'clock Mrs. Covington and children left for Easton driven by her chauffeur. No damage was done to the car.

EGGS AND OPULENCE.

$700,000,000 Presented The Country Last Year By Hens.

[From the Newark News.]

To a lot of individuals, not, however, including the hens, it is pleasant to read that the egg crop of the country during the last year amounted to $700,000,000, exceeding the average wheat crop of the last ten years. Particularly elated is the householder who finds on visiting the hennery of his accustomed and trusted purveyer of fresh-laid eggs that the price has gone up to 65 cents a dozen.

It may be a cause of pride to the little dominicker hen, which lays an egg a day and goes barefoot, to read that she is one of the greatest and the most dependable contributors to the nation's prosperity. Were it not for her a by-product of agriculture would not be the profitable thing it is. The little dominicker hen is not assertive, except on occasion. But she knows full well that her owner would, but for her, still be scratching his slow and laborious way about the country behind a spavined horse or two instead of luxuriously progressing in a car smoothly propelled by gasoline.

The farmer of today is not the farmer of a decade ago. Farming is a polite and effeminate occupation compared with the old order. The farmer who now goes to town in a seven-passenger car and has a tennis court on the front lawn does not face the hard knocks and the narrow life that featured the old order. Existence in the country, with the better roads, the social centres, the telephones, and one thing and another, is not what it used to be. The farmer, of course, takes credit for this to himself, pointing to his progressiveness, his improved methods, his increased efficiency, keeping pace with the times. But the little dominicker hen knows all the time that if she once stopped laying for a year there would be a different story to tell.

Hicks' Forecasts for June.

The first regular storm period is central on the 2nd, extending from May 31st to June 5th. The moon is on the celestial equator and at last quarter on the 4th. The period is still covered by the Venus influence, the mercury period is central on the 3rd, and the summer solstice period of the earth is beginning to make itself felt. Rising barometer and change to cooler will wind up this period.

Reactionary storm period will fall on and touching the 8th and 9th. This, it must be remembered, is at the crisis of magnetic and electrical excitation, which falls annually on and about the 10th to the 15th of June. Return of falling barometer, warmer weather and storms of wind, thunder and rain, may be expected to center on the 8th and 9th.

Regular storm period is central on the 13th, reaching from the 12th to the 17th inclusive. This period is in the center of earth's solstice period, with the moon in conjunction with earth and sun on the 12th. The north pole of the earth makes its least angle with the sun's equator about this period, causing our planet to take on an overwhelming stock of electrical energy.

Reactionary storm period is central on 19th, 20th and 21st. The moon is on the celestial equator and at first quarter on the 20th, and the earth is at its turning point in its orbit on the 21st. Many electrical storms, with increase of rainfall, will pass eastwardly over the country on and touching the 19th, 20th and 21st. Very warm, humid weather on and about the 20 and 21st, should be regarded as signals.

Regular storm period is central on the 25th, covering the 23rd to the 28th, inclusive. The moon is in perigee on the 25th, the central day of this vulcan period, in opposition to the earth and sun, at greatest declination south, on the 26th. On the same day mercury is at inferior conjunction with earth and sun, while Saturn is in conjunction with earth and sun on the 28th. Meantime earth is nearing its aphelion, or greatest distance from the sun, which point it reaches on July 5th. The culminating crisis of this period will fall on the 25th, 26th and 27th, about which days barometic depressions will be at their lowest, and storms of rain, wind and thunder will be sweeping eastward through the central region of the country.

FARMERS' CLUB HOLDS NEIGHBORHOOD SHORT COURSE.

Value Of Lime And Legumes In Building Up The Soil Is Discussed.

The Progressive Farmers' Club of Prince Georges County held a most successful neighborhood short course at T. B., March 16-20, the subjects being "Farm Crops" and "Poultry Husbandry." This was the last of a series of such courses which the Extension Service of the Agricultural College has held in a number of neighborhoods

CLASS IN SOILS.

this winter in co-operation with local farm organizations such as Granges and clubs. It has enabled many to have the benefit of teaching that the Agricultural College has never before brought directly to them.

Those attending the sessions of the short course were members of the club and their families, as the women folks as well as the men are enthusiastic in their attendance at the lectures. Demonstrations were given in selecting eggs for market, operating an incubator, mixing poultry rations, testing soil for acidity, judging seed corn, and in comparing different kinds of lime. Especial interest was taken in what Prof. W. T. L. Taliaferro, of the Agricultural College, had to say of the value of legume crops and lime in building up the soil for better production.

He said in part: "Nothing will help more in building up the yielding power of the soil than the use of legume crops, such as the clovers, alfalfa, cow peas, vetch and soy beans. These can be used for turning in as green crops or in growing a heavy sod as the case may be which fills the soil with humus and nitrogen plant food. It is not economy to buy commercial nitrogen at 15 to 20 cents a pound when the same results can be gotten by the use of legume crops, at the same time improving the moisture-holding power of the soil. Any of these crops can be easily grown on our Maryland soils, and with frequent applications of lime will give most of the plant food that our farm crops require.

The mistake, however, is often made of using too light an application. Not less than a ton of burned lime or two tons of ground lime stone or oyster shells should be used per acre. Such an application as this need not be given oftener than every once in five or six years so that the cost for lime would not be more than 50 to 60 cents an acre per year.

"In buying lime it has been found that if pure burned lime costs $2.75 per ton at the kiln, then hydrated lime or slacked lime should be $2.10 and ground limestone $1.50 per ton What kind you should use depends entirely upon its quality, price, and the distance it can be hauled to advantage."

DO YOUR HENS LAY IN WINTER?

ROY H. WAITE,
Maryland Agricultural Experiment Station.

When eggs are high in price, during the winter, do your hens lay? If they do, wouldn't you like to be able to sell most of them? If they don't, wouldn't you like to have eggs to use without paying a high price for them? You can keep the eggs laid by your hens in the spring, when eggs are cheap until winter if you wish. Of course these eggs cannot be sold as fresh eggs, but you can use them yourself for they are perfectly good for cooking purposes. Then you can sell the fresh eggs at the advanced prices.

The best method of keeping eggs is by cold-storage, but this is not available to most poultry raisers. There is a method, however, that can be used by anyone—the waterglass method The directions are as follows: Make up a solution using one part, by measure, of waterglass (sodium silicate) and nine parts of ordinary water which has been boiled and allowed to cool. An earthenware jar is usually considered best to keep the solution in. The eggs are put into the solution in as fresh a condition as possible.

It is best, where possible, to put the eggs in the day they are laid. It is also better to have them clean so that washing is unnecessary. They will also keep longer if they are sterile; no male birds running with the flock Keep at least two inches of the fluid above the eggs, cover the receptacle to prevent evaporation and store in a cool place. Waterglass can be obtained either as a liquid or dry powder. The powdered preservative was put on the market the past year.

TOPDRESSING WHEAT WITH COMMERCIAL FERTILIZER IN SPRING.

Where the soil is rather poor and deficient in nitrogen it will usually pay in a normal season to topdress wheat in the spring with 75 or 100 pounds of nitrate of soda and the same amount of acid rock per acre. If the soil is fertile so that there is no question of a good growth of straw being produced in a normal season, it is not worth while to fertilize. The fertilizer should be applied early in the season, the first part of April, in order that the early spring rains may dissolve it and carry it down to the roots, where it must go before it can be utilized by the plant

Courting With Mind on Court.

He—So Judge Blank proposed to Alice last night. She—Yes, and he made an awful break. When she asked him for time to consider his proposal he gave sixty days.—Boston Transcript.

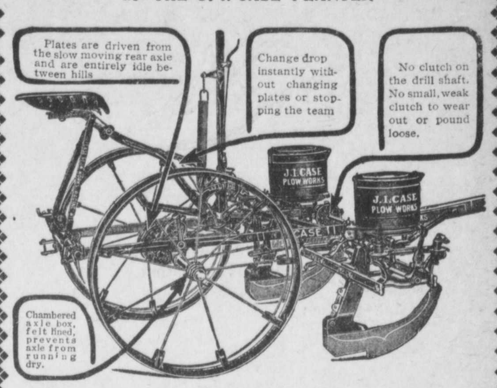
Fixing the Blame.

She—I wonder what makes the baby so wakeful? He—Heredity. That's what comes of you sitting up at night waiting for me to get home!—Philadelphia Ledger.

Avoid arguments if possible, and especially avoid them if impossible.—Judge.

"No Clutch on the Drill Shaft"

OF THE J. I. CASE PLANTER



On all Planters other than the J. I. CASE Power Drive the action of the plates is controlled by a clutch on the running drill shaft.

The clutch soon wears out and may fail to work when you need it most. Avoid this danger by buying a J. I. CASE Power Drive Planter where the parts performing the function of the drill shift clutch are found on the slow moving MAIN axle. They are made heavy and strong. Don't buy until you see this accurate and reliable planter.
