
Imagine the happiness of the women who get Hoosier Cabinets this Holiday season

Think of the joy of preparing over a thousand meals a year with a saving of half the time and energy.

Your wife will appreciate this Hoosier Cabinet as a million other women do.

You may not know why the Hoosier has such a marvelous sale—but she knows.

She knows about the sanitary sliding table of pure aluminum or porcelain—the spotless white cupboards uncluttered by partitions. She knows how the utensil tray and deep metal drawers save time, how the shaker flour sifter avoids grit and won't wear out; how the metal caster sockets make it easy to move without breaking casters. The food guide, calendar and pencil holder are among the 40 labor-saving features that give the Hoosier unrivaled supremacy for her.

So we gladly guarantee that if she isn't delighted with the Hoosier for Christmas we'll refund every penny.

And you can start now on the remarkably liberal terms of $1 down and $1 per week.

SUMMER SPRAYING NECESSARY FOR PERFECT FRUIT.

How To Prepare Self-Boiled Lime Sulphur—Time For Applications.

T. B. SYMONS,
Maryland Agricultural College.

The wise grower will aim to secure the very highest quality of fruit possible. In securing such fruit, the importance of summer spraying cannot be over-estimated. We have hundreds of instances where the hopes of remuneration from a good peach crop have been blasted by brown rot, and good sized peaches have brought poor returns, owing to a bad infection of scab. Moreover, it is a common sight to see apples seriously affected by one or more disease, making the crop from many trees practically unsalable. In order to prevent these losses, growers should practice late spring and summer spraying.

In this connection, the adoption of the lime and sulphur mixture as a fungicidal treatment for fruit trees in foliage, especially for peach, can well be considered one of the greatest modern advances in preventive treatment of disease. It can be prepared by the grower in the following manner:

Use eight pounds of flowers or flour of sulphur, eight pounds of stone lime, to fifty gallons of water. The mixture should be made in a kettle, barrel, or receptacle of sufficient size. Better results can be obtained with larger quantities. The necessary amount of unslaked lime should be placed in the receptacle and sufficient amount of water poured on the lime to start it slaking. When the lime begins to slake, add the eight pounds of sulphur. Stir the mixture and add water as needed to keep a pasty condition until the lime is all slaked. Do not allow any dark, yellow color to form, as it will, if the heat becomes too great at any point. If the sulphur is lump, it may be put in a finely divided condition by passing it through a fine mesh sieve. The heat generated by the slacking lime causes the sulphur to mix physically with the lime in very fine state, but should not be continued to form much of the sulfide combination indicated by the yellow or brown color. Therefore, it is essential that the proper amount of water be added to cause a violent boiling of the mixture for a few minutes and as soon as the lime is well slaked, add cold water to make the required amount. The self-boiled lime sulphur is now ready for use. The time to allow the mixture to boil will vary accordingly to the lime used, as some lime will slake more quickly than others. It should show only a faint yellow color before diluting.

WEED OUT THE MALE BIRDS FROM THE FARM FLOCK NOW.

ROY H. WAITE,
Maryland Agricultural Experiment Station.

Unless you have an especially fine male bird with your flock of hens it is nearing time now for you to dispose of him. There are several reasons for getting him out of the flock. He isn't necessary unless you are going to

TAKE HIM OUT.

hatch some late chickens. The space he takes up might better be used by a laying hen. It is not strict economy to feed him while getting no returns from him. And what is most important, the eggs laid by a flock in which no male bird is kept, are of better quality. They will keep longer especially in warm weather.

All who have ever operated an incubator know that the infertile eggs will come out of the machine on the fifth or seventh day apparently perfectly fresh. Furthermore, most incubator operators keep these infertile eggs until the machine hatches and then boil them up for feeding the young chicks. This, to my mind, is rather good proof of their keeping qualities.

If you can't get rid of your "roaster" in any other way, boil him and make a meal of him. If he is especially valuable as a breeder, fix him a small run away from the hens. Keep him out of the flock if possible.

What is needed and should be required of every rural teacher in either experience or training which acquaints them with the facts about farm crops, soils, farm animals, sanitation, and the best methods of presenting them in the school. Our Agricultural College is helping to solve this problem through its summer training school for country teachers, which opens for a six weeks' session June the 21st.

OYSTERS SERVED

WE are prepared to serve OYSTERS in all styles at our Restaurant on CROSS STREET, CHESTERTOWN.

FRIES, STEWS AND RAWS SERVED.

We invite our country friends to call on us when in Chestertown, and guarantee to give satisfaction. We want to thank the public for their generous Ice Cream trade the past summer, AND WILL ALSO BE PREPARED TO SERVE ICE CREAM THIS WINTER.

MRS. J. C. LOUD,
oc16-tf. CHESTERTOWN, MD.

ASKING ADVICE OF CONSTITUENTS.

Jesse D. Price Has Issued 10,000 Letters Asking for Suggestions as to Legislation Needed.

Representative Jesse D. Price, of the First Maryland District, is having a "heart-to-heart" chat with his constituents. He is now mailing out 10,000 letters asking the "advice of my constituents and friends as to pressing any needed legislation at this time."

Mr. Price says in the letter that the opinions of his constituents will be of great benefit in his efforts to help shape and effect legislation in accordance with the needs and desires of the people. In the course of his letter he tells what he is doing in Congress and comments on some of the big problems now before the national assembly. He says, in part:

"As a nation, we should profit by the great war tragedy now unfortunately being enacted in Europe. The question of preparedness is one seriously claiming the thought and attention of the American people. That we should reasonably strengthen the army and navy seems advisable, but I trust we may continue in the paths of peace.

"The present Congress will consider the important question of rural credits. I am co-operating vigorously with those who favor such legislation on this subject, as will bring to the farmers and small borrowers cheaper and longer time money for agricultural development and farm operations.

"We are also again to consider the question of a restricted immigration. From recent observations made in this country, it seems to me that every patriotic American would rally to the support of legislation greatly restricting immigration and demand its speedy enactment into law."

A Beautiful Tribute ta a Noble Woman.

Rev. Dr. W. L. Greenfield, a former pastor of Christ M. P. Church, writing in the Methodist Protestant pays the following beautiful tribute to that noble woman, Mrs. Minnie Maslin:

"This is to place a delayed but heartfelt tribute on the grave of a good woman. Mrs. Minnie Maslin died suddenly, October 8, 1915. She was a member of our church in Chestertown, and never did a church, so remarkable for the devotion of its people, have a more loyal or loving member. Over her, like a sacred spell, fell the influence of that 'elect lady,' Mrs. Josephine Hubbard, and to her, more than she was aware, she owed all she was as a christian. She was a devout woman. She had the simplicity to which Christ's presence and love were very real. The Lord was not only her help and her salvation, but her song. She proved the rich ministry of sacred music to the spiritual life. Her strong, vibrant voice rang in the worship of the sanctuary, and she rested from weariness, cheered her heart in many a sadness, and tided over many a temptation and struggle alone with her instrument of music and her hymns of trust and hope. By that noble group of men and women who constituted Christ Church for the long, blest years I was its pastor, almost all of whom have gone beyond the veil, Mrs. Maslin was honored and loved. She was a woman of childlike faith and prayer: a christian, the sincerity, the heartiness, the gladness of whose piety it refreshes one to remember. In advanced years, she died with the light of the morning on her face. I shall be glad when I again hear her sing! D. L. GREENFIELD."

How To Tell Parcel Post Charges.

If you know the zone in which is located the postoffice in which you desire to send a parcel post parcel you may figure out the postage required by a simply method.

If the office is in zone No. 1 or No. 2 add to the figure or figures representing the weight the numeral 4. If the weight is ten pounds the postage will be 14 cents, if it is five pounds the postage will be 9 cents, and if it is one pound the postage will be 5 cents.

If the office is in zone No. 3 multiply the weight by 2 and add 4.

If in zone No. 4 multiply by 4 and add 3.

If in zone No. 5 multiply by 6 and add 2.

If in zone No. 6 multiply by 8 and add 1.

If in zone No. 7 multiply by 10 and add 1.

If in zone No. 8 multiply by 12.

This scheme is good for packages up to and including twenty pounds. It was worked out by an ingenious attache of the Chicago postoffice.—Farm Life.

Alcohol and Pneumonia.

The United States Public Health Service brands strong drink as the most efficient ally of pneumonia. It declares that alcohol is the handmaiden of the disease which produces ten per cent of the deaths in the United States. This is no exaggeration. We have known for a long time that indulgence in alcoholic liquors lowers the individual vitality, and that the man who drinks is peculiarly susceptible to pneumonia. The United States Public Health Service is a conservative body. It does not engage in alarmist propaganda. In following out the line of its official duties it has brought forcefully to the general public a fact which will bear endless repetition. The liberal and continuous user of alcoholic drink will do well to heed this warning particularly at this season of the year when the gruesome death toll from pneumonia is being doubled.

SURE CATCH CROP FOR DRY SEASONS.

Sudan Grass Will Provide Plenty Of Roughage In A Short Hay Year.

NICHOLAS SCHMITZ,
Maryland Agricultural Experiment Station.

Sudan Grass should not replace clover, alfalfa, or even timothy where these can be grown profitably, because owing to its quick growth and heavy yield, it is very exhausting upon the land. Its chief value is as a catch hay crop—something to be used for helping out in years when the regular

SUDAN GRASS THRIVES.

crops of hay are short. The seedbed required is in every respect the same as that for corn. It should be firm and well-worked on the surface.

At the experiment station seedings have been made every two weeks from April 15th to August 1st. The results and experience thus obtained indicate that Sudan grass may be safely seeded any time between May 15th and July 15th, the best time lying between June 1st and July 1st. A good guide is to wait until after corn planting time. If seeded before this, there will be slow growth for the first few weeks, thus greatly helping weeds to get the start. When sown after July 1st, not more than one cutting can be expected.

For hay production, Sudan grass should be seeded broadcast. The best implement for seeding it is the grain drill. Good, clean seed feeds evenly through the wheat compartments of the drill at about the same rate wheat does; that is, if the drill is set to sow two pecks of wheat it will also sow approximately two pecks of Sudan grass. If the seed is not clean it is difficult to determine at what rate the drill should be set to seed the desired amount; in this case it may even be necessary to use the oat compartments. The seeding may also be done by hand or with one of the numerous broadcasting seeders on the market, and the seed then worked in. The best depth, everything considered, lies between one-half and one and one-half inches, depending upon the soil and the danger of baking after a heavy rain. Where baking is certain, planting between one-half and one inch is the best depth, but where the land does not become packed easily the seed readily forces its way through three inches of soil.

When seeding broadcast, 15 to 25 pounds of good seed is sufficient. Where the seedbed is firm, moist, and otherwise in good condition, and the soil is fairly fertile, 15 pounds is a plenty. If the land is rather poor and the seedbed is poorly prepared, then 25 pounds is better. For seeding in rows to be cultivated for seed, production, four to six pounds of seed will be sufficient.

BUILDING UP THE COMMUNITY WILL BE DISCUSSED AT COUNTRY LIFE CONFERENCE.

Ways and means of arousing their people to a deeper sense of obligation to build up community life and make their neighborhoods still more desirable places in which to live, will be the keynote of much of the discussion at the Country Life Conference for Rural Ministers, to be held at College Park, Aug. 3, 4 and 5. One of the most striking papers delivered at last year's Conference was on this very subject, of how the country might keep its own people, particularly the prosperous retired farmer and his family, who ought to be the most influential factors in building up a permanent community life. Dr. Carver said:

"So long as the original farmer is on the ground, the man who himself built the farm, used the energy of his own muscles with which to improve it, watered it with the sweat of his own brow, he will not forget the old neighborhood. But when the third generation comes along, having none of these memories, and none of those interests, then the real tendency begins to show itself in its full measure. The farm becomes merely the place from which the money comes to be spent in town. There is no interest in the farm at all, except as a source of income. The life is lived elsewhere, and the money is spent elsewhere, and the schools and the churches in the town are built up with the money that comes from the farm."

The early summer season is the most favorable time of the year to study agriculture and allied subjects at the Maryland Agricultural College. The College Farm with its experimental gardens, orchards, field crops, and fertilizer plots is at its best. These opportunities for first hand study in addition to the outdoor life and the freedom from the care of the school room will make a few weeks spent at your Agricultural College delightful and profitable.
