POULTRY NOTES

ITEMS OF INTEREST THAT WILL HELP OUR READERS WITH THEIR MANY PERPLEXING PROBLEMS

BY POLK T. BRAMBLE
(Proprietor of Bramble Poultry Farm)

The two local hatcheries are now in the peak of their production, and are sending thousands of chicks through the local mails four days each week.

Poultrymen, hatcherymen and others interested in the various phases of the poultry industry of Maryland will gather at the U. S. Department of Agriculture Animal Husbandry Farm at Beltsville, Maryland, on Friday, June 14, for the third annual summer meeting.

The meeting is held under the joint auspices of the Maryland State Poultry Association, County Poultry Associations, the University of Maryland Extension Service and the Poultry Division of the U. S. Department of Agriculture.

Beltsville is located on both the Washington-Baltimore Boulevard and the Baltimore and Ohio Railroad, about twenty-five miles from City Hall, Baltimore and about fourteen miles from the Capitol in Washington, or about five miles north of College Park. The Animal Husbandry Farm is located about one mile east of Beltsvile and can be reached by following the main gravel road which crosses the railroad tracks at the B. & O. Station.

Beltsville may be reached by auto, local B. & O. train, by bus or by trolley from Washington.

Complete details and program will be announced in the poultry letter and programs will also be available for distribution in early May.

The breeding and nutrition experiments will be of especial interest and there will be time to visit all ports of the farm with guides.

Those interested will find time to visit the Maryland State Egg Laying Contest and Poultry Plant at College Park.

Obtaining exceptionally high egg production during the spring months without due consideration and care for the health, vitality and body weight of the layers, may be likened to "Killing the goose that lays the golden eggs."

The most successful poultry feeders realize that feeding to maintain the body weight and health of the layers is necessary to profitable and sustained production. Many feeders fail to appreciate that increased egg production in the spring months demands increased grain feeding as well as an increased mash consumption. While increased grain and green feed allowance may not be conducive to the highest possible egg production in spring, it serves to prolong the period of production of the hen so that production continues into the summer and perhaps into the fall when eggs are a higher price than in the spring. As a rule, the layers should be fed slightly more grain than mash during the spring months in order to maintain body weight. As hot weather comes on, the grain may be slightly reduced, especially the corn.

Feeding liberally on grain with a moderate daily allowance of green feed is more conducive to the health and continued production of the flock than to allow the consumption of mash in the spring to exceed that of grain by weight.

A rather constant level of production through the winter, spring and summer months, and as far into the fall as the bird's condition permits, is more conducive to profits than decided fluctuations in production.

Prolapse of the oviduct, followed by cannibalism, is often induced or aggravated by the feeding of too little grain and green food in proportion to the mash being consumed. Most cases of prolapse may be checked or improved by increasing the allowance of grain and green feed.

A fifty per cent April to September production is likely to prove more profitable than a gradual reduction from an eighty per cent April production to a twenty per cent August production.

It usually pays to feed for the preservation of health and weight as well as production.

Easton will have a special election on June 6th. This was definitely determined by the Council this week when a special meeting was held to complete details. The election will be to vote on the bond issue of $40,000 for sewer and water connections in those parts of the town not now tapped, and especially in the new High School section.

The red spider is again causing considerable damage to some of the strawberry fields in the vicinity of Marion. The Gandy variety is most susceptible to this pest, although other varieties are also attacked.

Hosiery Hosiery Hosiery

ROLLINS HOSIERY

The question uppermost in every woman's mind when it comes to dress is:

"What about my stockings?"
"What color do I need?"
"Is the correct pair free of runners?"

The stock we present to you has jnst the shade you need and just the weight you like. With a guaranteed runner stop at the top, and guaranteed against defects.

Give yourself the pleasure of smoking a fragrant, mellow cigarette

CAMEL
CIGARETTES

WHY CAMELS ARE THE BETTER CIGARETTE

The Camel blend of choice Turkish and Domestic tobaccos has never been equaled.
This blend produces a delightful mildness and mellowness.
Camels are always uniform in quality.
You can smoke Camels freely without tiring your taste.
They do not leave a cigaretty after-taste.
Camels are a refreshing and satisfying smoke.
