BRISCOE
"The Best-liked Car in the Country"

A Power-Plant That's Full of "Pep"

The marvelous responsiveness of the long-stroke motor in the Briscoe Twenty-four is the wonder of everyone who rides in the car.

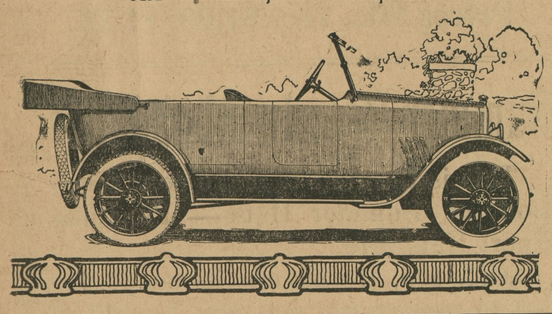
A quick pick-up on the getaway; an effortless smoothness of operation—and when you come to a hill or a bad stretch, a plentiful reserve of power that carries you through with never a falter.

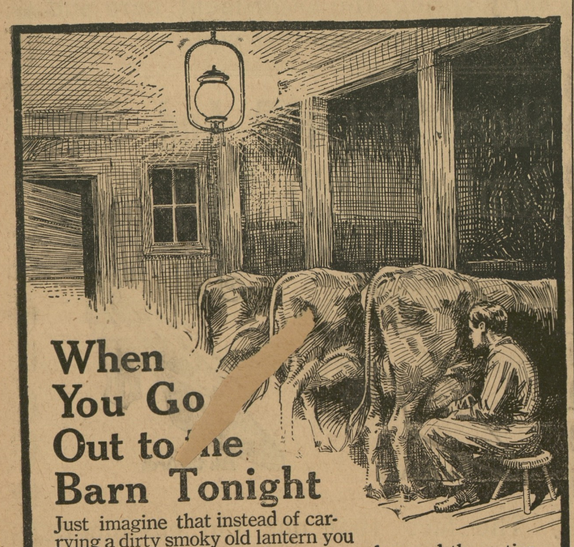
With a 3⅛-inch bore and a 5⅛-inch stroke, this Briscoe-built motor develops the last atom of power from a gallon of fuel—and the Briscoe design has reduced friction—and wear—to a minimum.

Come in and see this "latest Briscoe beauty"—it's a record-maker at the price.

Twenty-four $625 at Jackson
Electric starting and lighting; full equipment

EMORY BONWILL, Still Pond, Md.





When You Go Out to the Barn Tonight

Just imagine that instead of carrying a dirty smoky old lantern you simply step inside the door, turn a key and the entire place is instantly flooded with brilliant white light like sunshine.

Think how much easier it would be to work and how much more quickly you could finish up the chores.

Consider, too, the increased safety—if lanterns and matches were never again used in your barns. Then consider this fact, that you can now make these ideal conditions a reality by the installation of a

Pilot-Carbide-Outdoor Lighting and Cooking Plants

These plants are today furnishing this up-to-date lighting service to barns and out buildings on hundreds of thousands of farms in all parts of the country. In addition they supply the best light and cooking fuel for the home.

You will find the barn lighting feature alone worth the entire investment for the *Pilot*. Its use in the home, as well, means added happiness, comfort, safety and convenience for your whole family.

You can well afford the little it will cost. Write for illustrated catalogs and descriptive booklets giving all the facts. H

The Specifications of A High-Grade Car

The specifications of the 1916 Overland "Six" are those of a thoroughly high-grade car.

Its 45-horsepower six-cylinder motor, gives it ample power.

It has that certainty of ignition provided only by high-tension magneto. The starting and lighting system is of the two-unit electric type.

Electric control buttons are located right at your hand, on the steering column—a convenience found only in very much higher-priced cars.

Brief Specifications

Seven-passenger touring
125-inch wheelbase
35x4½-inch tires; non-skid rear
45-horsepower motor
High-tension magneto ignition
Two-unit electric starter
Electrically lighted
Headlight dimmers
Electric control buttons on steering column
Full streamline body design
Genuine leather upholstery
One man top
Full-floating rear axle
Extra long, underslung rear springs
Demountable rims, one extra

Cal-Sino
HOG RESTORATIVE

The great hog condition powder. **Don't wait** until your hogs get sick. Give it to them **now** to keep them well and help the backward or ailing ones.

Profit by last year's losses! Even if Hog Cholera did not hit you last year, you can never tell when it will, and a course of CAL-SINO will ward it off, expel worms, promote health and growth, and easily pay for itself in **extra weight.** It's mighty good for Sows and Shoats.

Costs about 10c. to 20c. per hog per month depending upon size. If you once try it, you'll **use it always.** Don't put it off—delay may cause you loss. Try it.

DISEASE PREVENTION FOR FARM HOMES

Screening Against Flies And Use Of Earth Closets Is Advised.

T. H. TALIAFERRO,
Maryland Agricultural College.

The advent of spring is closely followed in most places by the appearance of flies. In rural communities, especially on the farm, it seems practically impossible to prevent the fly nuisance on the farm, particularly so, if there are a number of animals about the place.

The fly, primarily a scavenger, would be a blessing if he would confine himself strictly to that business and remain at or near the manure pile, etc. He insists, however, on traveling, and thus finds his way into houses, even those in which an honest effort is made to keep the premises, particularly the kitchen, clean, and to put scraps, parings, etc., into properly covered cans.

The Fly Pest.

His favorite abode, when sojourning at the house, is the kitchen or dining room, and his choice as to a resting place and supply station is the food to be eaten or the utensil in which it is served. He is also very fond roaming over the face, particularly the lips, of a sleeping child. This desire is strengthened when evidences of indulgence in food, generally stick or greasy in nature, are found around the mouth.

Unless measures are taken which will prevent his doing so, the probability is that the fly, in his journeys to and from the house, has regaled himself upon human excreta or waste and that he is furnishing free transportation for typhoid, dysentery, and other disease germs which are found in the excreta.

Having reached the house, the fly, regardless of the fact that he may, for example, be teeming with colon bacilli, enters upon his regular routine, with the altogether too frequent result that there is an outbreak of typhoid fever.

Proper Sanitation.

On the farm it is not always possible, however, to have an up-to-date sanitary system. It is possible, however, to build or remodel a privy, so that the fly can not gain access to the human excreta. In this way, the opportunity for the fly to transmit certain disease germs to the food which is to be eaten in the house, etc., is minimized. It is imperative that such protection should be afforded, if health is to be conserved. The question of the slight increase in cost, if any, should not carry weight as an objection, for the reason that one outbreak of typhoid fever or dysentery, with the resultant loss of time and money, will prove far more expensive. Do not, however, make the mistake so often observed on farms, and elsewhere, of providing proper accommodation for everyone except the servants. The fly does not differentiate when he is foraging, neither do the colon bacilli consider social distinctions when choosing an abiding place. Screening the dwelling house is important, but it is not sufficient. The privy must be sanitary and fly proof. If it is fly proof, it is also impossible for fowls and animals to gain access to the human excreta.

Dry Earth Closet.

One of the best types of privies is the dry earth closet, in which the fresh excreta is covered with a small amount of dry earth taken from a box conveniently placed in the building. Lime also may be used with excellent results.

As to the construction of the building, individual tastes may govern, provided the fly is kept out and the place is kept in good order. Covers should be provided for the openings in the seat when not in use. The door, and particularly the window, should be screened to keep out flies and to permit the circulation of fresh air. Buckets or similar receptacles should be so placed beneath the openings as to receive the excreta. The buckets should be removed at intervals, cleansed and replaced. If it is not possible to obtain suitable buckets, a water-tight trough should be built with a stout ring in the end or side and sledge runners under it. The ring and the sledge runners will prove to be of great advantage when it is found necessary to remove the trough for emptying, etc. An application of lime in and around the trough or buckets from time to time will improve the sanitary conditions. A door which will fit tight when closed should be placed at the rear or side of the building to facilitate the removal of the buckets or trough. This door may be fitted with hinges or may slide in a groove. The latter is probably the better. It may be built entirely of wood, but a stout wooden frame covered with heavy close-meshed wire is preferable, as it permits the free circulation of air, which tends to keep down offensive odors.

Dispose Of Waste.

It is useless to build a sanitary, fly-proof building unless it is kept in good shape and a place provided for the disposal of the excreta. It may be buried, put in a compost heap, if thought safe, etc., but it must be protected from flies until the germs of typhoid fever, dysentary, etc., are destroyed by bacteria.

Any information desired regarding the construction, etc., of a fly-proof earth closet may be obtained from the Engineering Division of the Maryland Agricultural College, College Park, Md.
