FEDERAL LAND BANK

THE DAIRY

BUILDING FOR CALF IS BIG ESSENTIAL

Economical commercial dairying demands that the dairy calves be raised by hand rather than by nursing their mother. This fact makes it necessary to provide a place to keep the young calves while being fed milk, say Prof. J. P. LaMaster, chief of the dairy division, Clemson college, who suggests that the essentials for such quarters are: (1) that they can be easily cleaned; (2) provided with an abundance of sunlight; (3) properly drained, so as to prevent any surface water from entering, or from becoming damp from any cause; and (4) an arrangement which will permit the feeding and care of the calves with the least amount of labor in quarters that give the calves enough room.

Calves raised on skim milk in practically every case develop the habit of sucking one another's ears, navels, and udders immediately after being fed milk. This habit often results in the udders being misshapen, or entirely blind in one or more quarters when the heifer comes in milk. If this habit was limited to the period just after feeding milk, the difficulty could be overcome by keeping the calves in stanchions for 30 minutes or more after each feeding; but during the day, when the young calves become hungry, they will start sucking again.

To prevent this trouble each calf should have a small pen of its own. This is not as hard to provide as might seem. A long pen six or seven feet wide can be divided into pens by placing gates across at proper distances, depending on the number of calves on hand and the space available. To make it easy to get the calves in and out of the pens and to clean the pens, these gates may be fitted with a cord in the center which passes over a small pulley overhead, and with a weight attached on the other end heavy enough to balance the gate. This will allow the gate to be raised overhead out of the way when not needed. The gate should be fitted into grooves at each end formed by using a 2 by 4-inch upright and 1 by 3-inch slats nailed on each side to form the slot. Such an arrangement is inexpensive and makes a safe and convenient pen for young calves.

"War Map" Shows Extent of Bovine Tuberculosis

(Prepared by the United States Department of Agriculture.)

Proceeding on the principle that one can fight an enemy best if he knows the enemy's position and strength, the United States Department of Agriculture has issued a map-poster showing the extent of bovine tuberculosis in the country. The map is the central feature, but the poster also contains explanatory matter and figures showing the degree of infection in various parts of the country. Six different intensities of shading enable any person to see how the county in which he lives compares with others in his state and in other states with respect to the prevalence of cattle tuberculosis.

An encouraging feature of the nation-wide campaign to eradicate the disease is the conspicuous appearance on the map of "modified accredited areas." These appear as white spots against tinted and red backgrounds and represent the numerous counties which have reduced tuberculous infection among cattle to less than half of one per cent.

The combination poster and map is largely for the guidance of veterinarians and sanitary officials engaged in the work of eradication, but it is an illuminating presentation of the subject for live-stock owners also. Officials of the bureau of animal industry suggest that every live-stock association should have a copy of this "war map" against the disease as a guide in the purchase of breeding stock when its health status is not otherwise known. The poster measures 20 by 28 inches, is printed in red and black and may be obtained free on application to the United States Department of Agriculture, Washington, D. C.

Dairy Hints

Cows do not enjoy moldy silage, and it makes horses sick.

* * *

Maybe scrub bulls got that name because they keep the bank account cleaned out.

* * *

Breeding, feeding, and general management of the dairy herd are the three fundamental factors to be considered in making dairying profitable.

* * *

Breeds of dairy cattle vary in their origin, size, color, and in the quantity and quality of the milk they produce.

* * *

Successful dairymen and cow buyers insist upon cows which represent some one of the distinct dairy breeds, the choice being largely a matter of personal preference.

* * *

A dairyman who began to weigh the milk from his cows, and to keep a record of each milking, found that the cow he thought was the poorest in his herd gave next to the highest yield.

Reduce by Breathing, Says French Doctor

Bed rest instead of physical exercise, and deep exhaling from the lungs, in addition to the usual nonfattening diet, are prescribed as a cure for obesity by Dr. G. Leven, general secretary of the Therapeutic society of Paris.

Doctor Leven teaches his patients to breathe out so hard that they bend the flame of a candle and to inhale only very slightly. The breathing can be done lying in bed, sitting up or standing erect. Series of five exhalations are repeated every half hour fifteen to twenty times a day. One patient lost fifteen pounds in twenty days and another sixty pounds in the course of eight months.

When a person overeats, Doctor Leven believes, the solar plexus is irritated and this disturbs the functioning of those cerebral centers that regulate the destruction of fat. Other conditions may also cause this disturbance. The course of treatment prescribed is claimed to counteract the effect.

Nuts and Milk Chief Materials for Buttons

An older button than that of mother of pearl was the so-called horn button, which was really hoof. The hoofs of cattle were boiled and cut up into slices and then pressed into buttons by means of metal dies.

At the present time the two most widely used materials for buttons are nuts and milk. The Corozo nut is the favorite missile of the monkeys in certain riverside regions of Central and South America, and its kernel of vegetable ivory can be turned upon a lathe, cut to any shape, and dyed to almost any color. Its usefulness to the modern button maker is only equaled by that of sour milk. Milk from which all the cream has been separated is soured either naturally or by means of rennet or some acid, and converted into erinoid or galalith, from which immense numbers of fancy buttons are made.

Germ "Boom"

In London you can get a bargain in germs. A quarter of a dollar will buy millions, and you can have your choice of more than 2,000 kinds.

There has been a great demand for germs lately from laboratories and hospitals, according to Popular Science Monthly, and workers in the Lister Institute are kept busy feeding, raising and bottling them to ship to the far corners of the earth.

Many of the germs are cranky boarders, and the chef has to make special dishes for them. A favorite food is beef tea, but others will touch only dishes in which eggs are used. Topers in the assembly demand alcohol in their foods.

Some of the germs demand a lot of coddling. The "flu" germ, for instance, has to be kept at a certain even temperature in an incubator night and day lest it catch cold and die.

Tribute to the Horse

Oh horse, you are a wonderful thing; no buttons to push; no horns to honk; you start yourself; no clutch to slip; no spark to miss; no gears to strip; no license buying every year with plates to screw on front and rear; no gas bills climbing up each day, stealing the joy of life away; no speed cops chugging in your rear, yelling summons in your ear. Your inner tubes are all O. K., and, thank the Lord, they stay that way. Your spark plugs never miss and fuss; your motor never makes us cuss. Your frame is good for many a mile; your body never changes style; your wants are few and easy met; you've something on the auto yet.—St. Croix Courier.

Historic Toys

The 2,000-year-old armlet found on Selsey beach and used by children as a collar for the cat before the discovery of its real nature gained it a place in the British museum, recalls another valuable plaything. It was in 1867 that a Dutch farmer obtained possession of a bright stone with which some Boer children were amusing themselves. This "toy," which eventually sold for £500, after exhibition in Paris, brought the discovery of the diamond fields, round which so much of the recent history of South Africa has centered.—London Times.

Making Her Say It

The prettiest girl sighed. All through the foxtrot her partner had been relating "curious facts" to her about everything under the sun, from pigs to parliament, till she was bored almost to tears. Now he was on the subject of heredity.

"It's a curious fact," he remarked, "but my brother, who was born on the same day of the year as I was, but who's three years older, is my exact opposite in every respect. Do you know my brother?"

"No," murmured the girl, "but I should like to."

Girl's Essay on Men

From a schoolgirl's composition: "There are three kinds of men—husbands, bachelors and widowers. An eligible bachelor is a mass of obstinacy surrounded by suspicions. Husbands are of three varieties—prizes, surprises and consolation prizes. A widower is a man someone has rescued as he goes down for the third time. Making a husband of a bachelor is one of the highest plastic arts known to civilization. It requires science, sculpture, common sense faith, hope and charity, espe charity."—Exchange.

Mr. Farmer

Do you know that within the past eighteen months the Maryland-Virginia Joint Stock Land Bank of Baltimore, through Wm. Frazier Russell, Jr., its attorney, has loaned to Kent County Farmers more than $90,000.00?

Do you know that you pay no bonuses or commissions to secure a loan through this bank?

Do you know that when you borrow $1000.00 you get a draft for $1000.00?

Do you know that every time you yau your interest you cut down the principal mortgage indebtedness?

Your neighbors are getting "wise." It will cost YOU nothing to learn.
