From the Boston Courier.

An Affecting Story of Blighted Affection.

He was an Anglo-African,
  Who lived in Flo-ri-da,
And used to curl himself o'nights
  Under a pile of hay;
And dined on little pig-i-es
  For which he did not pay;
In totein chickens from their roosts
  He had a funny way.

Her name was Arrabella Smith,
  A strongish minded girl,
Whose light-complexioned, yellow hair
  Had never learned to curl,
She kept the village school, she did,
  And was the village pearl,
And the first time I met with her
  My heart was in a whirl.

It was in Mass-a-chu-si-etts,
  I fell in love with she,
And fondly hoped that Arrabell
  Had done the same with me;
I told her lots of soft, soft things,
  Down by the salt, salt sea.

In all progressive move-mi-ents
  We were among the van,
And walked together to the church
  Called Unitarian;
Wherein they preached about the wronged,
  Down-trodden African—
We used to think Charles Sum-ni-er
  A most gu-lori-us man.

So when the freedmen were set free,
  My Arabella thought
She had a mission unto those
  Who val-i-ently fought,
And so she went to Florida,
  To see that they were taught,
Where, in the Freedmen's Beaurieu she
  Most diligently wrought.

'Twas there she met with Pompey Jones,
  Who slept beneath the hay,
And dined on little pork-i-es
  For which he did not pay,
And with his banjo and his bones
  He stole her heart away;
So off they went to Captain Jinks,
  And married were one day.

Now I am left disconsolate,
  With comforts not a one,
And nights and days I shed dry tears,
  Because this thing was done,
And you may guess how much I cuss
  Miss-ce-ji-na-ti-on.

Preserving Fruit--A Cheap and Good Method.

All fruits, simple as they look, are very compound bodies. A simple strawberry e. g. consists of more than a dozen elements. As soon as any body, vegetable or animal, is ripe, it begins to die; for death is only a change among those elements whereby new and different compounds are formed. And in organic substances, as fruits, the process by which the death change is effected, is fermentation. Hence to prevent fermentation is to keep those substances a long time in their natural state and condition. The great agent which sets up this fermentation, is the oxygen of the air; to exclude the air, therefore, in the most perfect manner, is the great secret of preserving fruits.

There are various methods for this. The old, and still too common method, was to boil the fruit a long time in sugar, pound for pound, The boiling expelled the air from the fruit; the sugar taking the air's place and preventing its return into the fruit. But this is a relic of barbarism belonging to those times when bricks were brought from Holland to this land of wood and clay. Both science and experiment have fully shown that any thing or measure that excludes the air well preserves fruits and vegetables from decay as well without as with sugar. For many table vegetables, as green corn, peas, &c., are preserved without any sugar whatever—simply by removing, and keeping from them the air, by about the same process herein recommended for fruits.

FRUIT VESSELS.

The name of these is legion; self-sealing, patent rubbers and wires, soldered tin cans, &c.; but we doubt whether there is anything better than good strong glass bottles, such as every house has, or can get cheaply at the druggists. A wide-mouthed quart bottle or jar is the best form and size. Small well-glazed earthen or stone jars are cheap and keep fruit well; but their want of transparency prevents seeing how the preserves are doing—giving glass a great advantage. Never use tin; the acids of the fruit corrode this, so as, after being used a year or two, to impart an iron color and taste to the preserves. Close-fitting stoppers of cork, or some soft dry wood are necessary.

KINDS OF FRUIT.

Fully ripe, but not over-ripe fruit, is the true kind; for over-ripe means the early stages of the death process, as stated early in this article. And every particle of decayed fruit should be rejected; for this is the putrefactive process going on, which is itself that "little leaven that leaveneth the whole lump."

TO PREPARE THE FRUIT

The method recommended by the highest scientific authorities—one which our family uses with good success—is this: For small juicy fruits, add in layers as you would salt meat, as much sugar as will give the right flavor for table use, to stand over night. For dryer fruit, as apples and pears, some water is added to make a syrup—sugar, 2 lbs.; water, 1 quart, is a good rule. In the morning put the fruit with all their liquids as above, into a porcelain vessel—a new tin pail does well—and heat just enough to well scald through.

BOTTLING.

The bottles or jars being thoroughly cleansed by repeated washings in saleratus water, are to be put into a dish of cold water, and heated to the boiling point, as all glass may be without hurt by this slow heating method. Some melted cement previously prepared—2 parts beeswax, 2 parts rosin, 1 part tallow; a cheaper, 1 lb. rosin, 2 oz. tallow—is to be on hand and melted while the fruit and the jars are heating. Into the hot jars pour the hot preserves, filling them full to the stoppers, when these are put in level with the top of the jars. Before putting in the stoppers wipe dry both the inside and the outside of those parts of the jars where the stoppers and the cement are to go, to insure better adhesion. Spread on the cement so as thoroughly to cover all places which can admit air. Keep in a cool, dry cellar. Many as these directions are, they are all performed in less time than it takes to give them to you; and if faithfully done, it will be found a cheap and good method—only liable to the objection of "not keeping well"—all good things being too quickly consumed. That's all.

A little thing more will add to the security. All these processes of heating, have been solely to expel the air, and not to cook the fruit. All heated masses shrink in cooling; so that the jars, brimful when hot, will have an empty space—a vacuum—when cold, which the air seeks to fill by an atmospheric pressure of 15 lbs. to the square inch—50 or 60 lbs. to a jar stopper, which this great pressure will wholly or partly drive in unless very tight-fitting. This is the cause of much preserve-spoiling; but may be easily prevented in this way. As soon as the cement is applied, put on a mustard-box cover with melted cement. This both adds to making the jars air-tight, and relieves the stoppers from all danger by the pressure. If you haven't enough of those covers or other things, for a few cents the smart boys in the tin shops will make enough to save many dollars—besides encouraging the fine fellows by your patronage.

JELLIES.

While in making preserves the sole object of heat is to expel the air contained in the fruit, a different principle governs in jellies; these are mere combinations of the fruit elements by a sort of distillation. Hence for the production of these, heat is the right agent; tolerably hot and quick cooling is proper. Yet too much heat oversteps the distillation or jelly process and runs into the candy stage, giving a black, sticky mass, bearing about the same relation to true jelly as the worst sugar to the best granulated.

STONE-FRUITS.

One of the most intense poisons known—prussic acid—exists largely in the stones of fruits. For this reason cattle are sometimes killed by eating wild cherries. Preserving these fruits, as most people do, without removing the prussic acid part—the pits or stones—is, therefore, highly dangerous, and contributes not a little to the poor health, if not the mysterious deaths of many families. For it matters not whether those parts are eaten; for if cooked and allowed to remain with the soft parts of the fruit, the prussic acid diffuses itself through, and poisons the whole. We never eat a spoonful of plum preserves prepared in that manner without feeling the effects of prussic acid. As soon as the pits separate from the flesh remove them.

Treatment of Young Colts.

Every man who raises colts should have an easy fitting halter—the five ring leather halter is the best, but a rope head-halter will do, always something that he cannot break—and put it on every colt when he is but a few days old, when he can be easily handled. Lead him around with it a little, just enough to let him feel its restraint. Then tie him in the stable where the mare is, but a little distance from her, being careful to place him where he cannot get his feet hung, and watch him until you are satisfied that he "accepts the situation," You may then leave him an hour or so, when he should be turned loose. This operation should be repeated several days, and the mare may be led away to water while the colt is tied, and then she may be used for an hour or so, thus gradually accustoming them to be separate, and in a short time the mare may be used in the field or on the road three or four hours, while the colt is tied in the stable, and neither of them manifest much restlessness. It is very often desirable to use the mare when it is inconvenient to have the colt following, but unless they are accustomed to the separation while the colt is quite young, she will become restless and unfit for use, especially if she is of nervous temperament. When the colt is haltered he should be curried and petted, but never in any case should he be teased so as to leer or put himself in an attitude of self-defence. Treat him so that he will always be glad to have you near him. A colt thus accustomed to the halter, may be tied to the collar of the harness when it is necessary to take the mare away from home for the entire day. He will very soon learn to walk quietly by the side of the dam, and is not liable to get lost when you go to the city, or where there may be other horses. If the colt is tied a considerable portion of every day while the mare is at work, he should be turned loose as soon as she returns, and have the privileges of the pasture lot as much as possible; indeed, after he has become well accustomed to the absence of his mother, he may be left in the yard or lot when she is taken to the field to work, provided the fence is high and tight. Colts thus treated will be docile and easy broken to the harness, and if the practice of tying them in the stable at nights is kept up, they will be worth twenty per cent. more when three years old than they would be if they were never handled.—*Journal of Agriculture.*

☞ Dr. Chalmers beautifully says:—"The little that I have seen in the world and known of the history of mankind teaches me to look upon their errors in sorrow, not in anger. When I take the history of one poor heart that has sinned and suffered, and represent to myself the struggles and temptations it passed through—the brief pulsations of joy; the tears of regret; the feebleness of purpose; the scorn of the world that has little charity; the desolation of the soul's sanctuary, and threatening voices within; health gone; happiness gone—I would fain leave the erring soul of my fellow-man with Him from whose hands it came."

☞ "Off she goes," said a lady, speaking of the train as it was starting. "You have mistaken the gender, madam," said a gentleman, "this is a mail train."

☞ A bit of a paradox. When a shoemaker is going to make a boot the first thing he uses is the last.

1869. 1869.

TURKHEIMER & CATLIN,

POPULAR

CLOTHIERS.

MEN & BOYS

CLOTHING.

WHY THE GREAT MASS OF PEOPLE WILL BUY THEIR CLOTHING AT

☞ Turkheimer & Catlin's. ☜

FIRST.—BECAUSE WE HAVE JUST RETURNED FROM THE EASTERN MARKET, WHERE WE HAVE

Selected

WITH

Unusual care

A SPLENDID STOCK OF MEN'S, BOYS' AND YOUTHS'

CLOTHING

WHICH WE PURCHASED FOR CASH, AND WHICH WE SHALL OFFER TO OUR PATRONS AT

LOWER PRICES

To My Friends and the Public.

FEARING that I may not long be able to undergo the arduous duties of my profession, I have this day associated with me DR. J. A. PERKINS.

From my knowledge of Dr. Perkins, I without hesitation, recommend him to my patients. If any one should object to the services of either, they will so state when sending, that any thing unpleasant may be avoided. The one preferred will give all or most attention. Consultations will be held without the consultation fee. Our charges will correspond with those who practice around us. We herewith offer our services and pledge our best efforts to discharge our duty.

T. H. WHALAND.

N. B.—I shall proceed to settle my books, by legal process, upon all accounts remaining unsettled for more than two years.
