such as Binders, Mowers, Rakes, Clover Leaf Manure Spreaders, Empire Wheat Drills and REPAIRS for all above machinery.

Also Bickford & Huffman Grain Drills and Repairs for same.

Also the best Deering Standard BINDER TWINE.

Two Brands of FERTILIZERS also handled.

CHAS. H. JEFFERSON

PHONE 118-11 CHESTERTOWN, MD.

POSITIVE PROOF.

Should Convince the Greatest Skeptic in Chestertown.

Because its the evidence of a well-known Chestertown citizen.

Testimony easily investigated,

The strongest endorsement of merit.

The best proof. Read it:

Harry Hodgkin, merchant, Mill St., Chestertown, says: "I had various symptoms of kidney trouble. Pains through my loins annoyed me and the kidney secretions were irregular in passage. My supply of Doan's Kidney Pills was procured at Toulson's Drug Store, and they made me feel better in every way."

Mr. Hodgkin is only one of many Chestertown people who have gratefully endorsed Doan's Kidney Pills. If your back aches—if your kidneys bother you, don't simply ask for a kidney remedy—ask *distinctly for Doan's Kidney Pills*, the same that Mr. Hodgkins had—the remedy backed by home testimony. 50c all stores. STAND UP STRAIGHT.

Keep the Chest Wide Open and Avoid the Great White Plague.

The best way to avoid consumption is to stand up straight, according to the Bulletin of the American Medical association. The writer says:

"The first essential in the avoidance of tuberculosis of the lungs, or consumption, is to keep the lungs strong, so that if the germs are breathed they can do no harm. One of the most important things in keeping the lungs strong is to keep the chest wide open so that the lungs can be properly used. If the body is drooped or stoops or if the shoulders are allowed to drag forward (round shoulders) or if the head is carried forward instead of well back over the shoulders the chest must be flattened, the breathing must be shallow, and the lungs, not being freely used, become weak.

"It is in this type of chest that tuberculosis usually begins. The consumptive is usually narrow chested, with drooped shoulders and with the head craned forward.

"While the development of a strong, well formed chest is one of the most important factors in preventing tuberculosis, the same thing is to be desired if the disease has once started. Not only should we live in the open, but we should stand up straight and learn to 'throw a big chest,' so that the lungs can grow strong and the fresh air be taken in.

"The runner, the singer or any one who is obliged to make sustained effort is taught to stand and sit with the chest high, so that the lungs can be used to the best advantage, and if every one would do the same thing there would be less tuberculosis because there would be fewer weak lungs."

GLOOMY CARLYLE.

His Pessimism and His Wonder at the Optimism of Emerson.

Thomas Carlyle's friendship with Ralph Waldo Emerson is a matter of history, but Charles Eliot Norton tells in his published letters that Carlyle marveled at the optimism of the American philosopher. Writing in 1873, Norton says: "As we were sitting together just after my coming in this afternoon, Carlyle spoke of Emerson. 'There's a great contrast between Emerson and myself. He seems verra content with life and takes much satisfaction in the world, especially in your country. One would suppose to hear him that ye had no troubles there and no share in the darkness that hangs over these old lands. It's a verra strikin' and curious spectacle to behold a man so confidently cheerful as Emerson in these days.

"'I agree with ye in thinkin' that the times that are comin' will be warse than ours, and that by and by men may through long pain and distress learn to obey the law eternal of order, without which there can be neither justice nor real happiness in this warld or in any other. The last man in England who had real faith in it was Oliver Cromwell.

"'Well, it may be as you say. I'm not such a verra bloody minded old villain after all (here a cordial laugh), not quite so horrid an ogre as some good people imagine. But the warld is verra black to me, and I see nothin' to be content with in this brand new, patent society of ours. There's nothin' to hope for from it but confusion.'"

ELECTRIFIED CELLULOID.

Pulling a Couple of Strips Between the Fingers Changes Them.

If you will take two thin lengths of celluloid, put them in contact and then suddenly and rapidly pull them between your fingers you will observe they both have become electrified—not only on their outside surfaces, where the friction of your fingers caused a negative electrification, but also on the inner surface of the celluloid.

The strange part about this is that one of the inner surfaces of the piece is positively charged and the other one is negatively charged. If one of them is slightly curved during the friction the convex one will be positively charged and the concave sided one will be negatively charged.

It seems, therefore, to depend upon whether the surface is concave or whether it is convex—depressed or expanded—to produce negative or positive electricity. Even the most minute, imperceptible curvature is sufficient to give the expected result. It also is impossible to pull the strips of celluloid through the fingers without producing such strong electrification that one piece will support the other.

Even the vapor pressure of liquids is stronger at the convex surface than at the concave. If electrons are considered as particles of gas dissolved in solids—as they once were—or as negative electricity, there will be a greater tendency for the electrons to escape from the convex side, which therefore will be left positively charged. This also is in perfect accord with the latest researches upon electrons.

Interesting experiments can be made by following the above directions. Celluloid has peculiar properties for tests.—New York Press.

Inflammable Celluloid.

Celluloid, being first cousin of gun cotton and closely related to nitroglycerin, is highly inflammable and should never be brought in close proximity to a flame. Celluloid is a compound of cellulose or vegetable fibrine, reduced by acids to guncotton. Cellulose is found in all vegetable life, particularly in young plants. It is a starchlike substance. Cotton fiber is principally cellulose. After the cotton fiber is cleaned it is submerged in acids, which quickly reduce it to cellulose in the form of a thick, pasty, semi-transparent mass. Camphor is added further to thicken it, and the required coloring matter is thoroughly mixed in, after which the celluloid is molded by heat and pressure into various useful and ornamental objects, such as combs, boxes, pins, paper cutters, ornaments, etc.—New York World.

Learn to Write Well.

First legibility, second slightliness should be the endeavor in handwriting and let the "character" and the "individuality" take care of themselves. If you wish to devise a signature hard to forge that is another thing, but one's everyday handwriting should be plain and as good looking as one can make it. The art of writing a neat legible, well punctuated, correctly expressed and spelled letter should be long to every high school graduate much more to every college graduate, and the thanks of the community are due to those who are testing and trying to improve our methods of education; but they must remember that the letter style is properly more loose and conversational than any other and therefore should not be criticised in just the same way.—Kate Upson Clark in Leslie's.

Farmers Should Raise Well-Bred Horses

Should Plan To Meet European Demand—Fall Breeding Recommended.

R. H. RUFFNER.
Maryland Agricultural College.

To meet the probable European demand for horses during the next few years, Maryland farmers may well turn their attention to the possibilities in raising well-bred horses, although they

A GOOD MOTHER.

are not advised to undertake the business too hurriedly or at too great an outlay of capital for breeding stock. It is urged, however, that the farm work should be done whenever possible by good mares which should be bred to good stallions. Only horses of first quality may be profitably raised today. Inferior horses are a drug on the market, and their production is to be discouraged as much as the production of good horess should be encouraged.

There is no better time than the present for the ambitious farmer to breed his good mares with a view to supplying the market that the next few years will open up to him. Some may no doubt object to fall breeding. As a matter of fact, the fall is a better time for breeding a work mare than the spring. The colt dropped a year from now will not, it is true, be on pasture for some months. On the other hand, he will be suckling his dam at a time when she is not as hard worked as she is in the open season. The colt also during this time depends far more on its dam for its nourishment than on what feed it can pick up. By the time he is ready for grain and hay feeding the winter will be well over and the spring pasturage will be coming on at the very time when the growing colt needs it the most in making growth. The dam at this time also is needed for heavy farm work, yet the colt will not suffer as he would when still a few weeks old if his mother is overworked or not quite up to her best condition.

Most of our horses must be produced by the small farmer rather than the owner of a breeding farm. Such a farmer cannot always afford to give the dam as good a chance as she should have for giving her offspring the very best of nourishment. This plan avoids to a great degree any setbacks to the colt or loss of the use of the mare at a busy time. It also enables many farmers whose main business is grain production to breed a few well-bred workers, that will pay well for the time and effort expended on their raising.

GET RID OF ROUP IN YOUR FLOCK

ROY H. WAITE.
Maryland Agricultural Experiment Station.

A number of cases of roup have been reported recently. The immediate cause of this disease is one or more of a number of different bacterial organisms. It is probable that most of these germs are present and available to the fowls at all times. As a rule, however, they cannot get a foot-hold

A BAD CASE OF ROUP.

and a chance to put in their deadly work until the birds become weakened in some way so that they cannot ward off the attacks. Drafts, dampness, sudden changes in temperature, faulty feeding, uncleanliness, lice, and mites, in fact, anything which depresses the birds, tends to weaken them and at the opportune time, the germs get in their work. After the bacteria have gone through a few birds they gain virulence or strength and are then able to attack stronger birds. The symptoms of roup are not very clearly defined. It is hard to tell where colds leave off and roup begins, but when your birds are coughing and sneezing, having inflamed mouths, nostrils or eyes, a running at the nose or swollen eye socket, it is time to see what is going on. Look for the cause and remove it, separate and isolate all affected birds and keep them in a dry, clean place. Get rid of all weak birds, and if you simply must give some medicine, give the whole flock a dose of Epson salts—a teaspoonful to each two birds. The whole amount of salts can be dissolved in water and the water used to moisten a feed of mash. Put a few drops of carbolic acid in the drinking water. Birds can stand a good deal of carbolic acid.
