FAMILY DOCTOR MADE MILLIONS OF FRIENDS

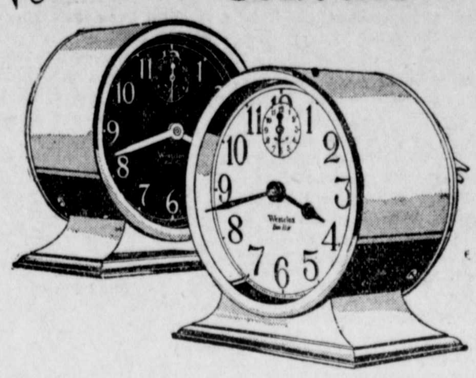

Fifteen years after his graduation, Dr. Caldwell became famous for a single prescription, which now, after forty years, is still making friends.

Today Dr. Caldwell's Syrup Pepsin is the world's most popular laxative. Millions of people never think of using anything else when they're constipated, headachy, bilious, feverish or weak; when breath is bad, tongue coated, or they're suffering from nausea, gas, or lack of appetite or energy.

Dr. Caldwell's Syrup Pepsin is made today according to the original formula, from herbs and other pure ingredients. It is pleasant-tasting; thorough in the most obstinate cases; gently effective for women and children. Above all, it represents a doctor's choice of what is safe for the bowels.

AGRICULTURAL NOTES

STATE FARMERS URGED TO BE CAREFUL WITH SEED CORN

To insure the planting of seed corn that is adapted and of good quality, Maryland farmers are urged to exercise extreme caution in the handling of this Year's corn crop, no matter how small it may be. According to F. W. Service, because of the drought, not only will there be a short crop of corn on a great many of the farms in the State, but corn of the varieties grown in Maryland and surrounding States is going to be in great demand in the East for seed purposs. For this reason, it is pointed out, while the farmer naturally wants to save sufficient grain for his own seed purposs, if he has any of the 1929 crop left over, it might be well to consider storing it for sale as seed corn. The condition of the corn may be readily ascertained through a germination test.

In this connection, Mr. Oldenburg emphasizes that corn damaged by drought may not necessarily be damaged for seed purposes. If the individual kernels are developed and will germinate, they will produce just as good plants whether there are 5 or 500 on the cob. A four-inch nubbin with 100 well-developed kernels of a productive, adapted variety from a local drought-ruined field is likely to be better seed corn for 1931 than a ten-inch ear from 100 miles north or south.

However, whatever is to be done should be done now. First, size up your crop carefully. There may be low spots from which enough ears or nubbins may be saved for seed. If so, get this out as soon as mature and store it where it will be safe from mice and insects. If you can't get seed on your own farm, possibly a neighbor will have some to spare. Above all things, get your seed as soon as possible since it may be very high by next spring and you may be forced to use a variety not adapted to your locality.

Feeding Of Calves Described In Bulletin

Dairymen and cattle breeders of the State can obtain latest information on the feeding of calves from a new bulletin recently issued by the Agricultural Experiment Station of the University of Maryland. The authors of the publication are L. W. Ingham, Dr. DeVoe Meade and M. H. Berry.

The bulletin gives the results of a year's experiments conducted by one of the authors during which time a close check was kept on the relative efficiency and resulting increase in growth and development from feeding a number of the more common calf feeds. One interesting fact brought out by the tests was that a normally healthy calf can be raised on approximately 100 pounds of whole milk and from 60 to 85 pounds of skim milk powder. Part of this amount of skim milk powder may be fed in liquid form and part in dry form.

The bulletin may be obtained free of charge by writing the University at College Park.

Marglobe Variety Of Tomato Makes Good Showing

Reports from L. M. Goodwin, canning crops specialist for the University of Maryland Extension Service, are to the effect that Marglobe variety of tomato, recently developed and introduced by the United States Departmnt of Agriculture, has shown very favorable growth and production in Maryland during the past summer and promises to be profitable variety for the many growers in the State.

Because of the unusually dry season, it has not produced a normal crop, but it has withstood the blossom and rot disease better than any other kind of tomato grown in this section, according to Mr. Goodwin. As a result, he reports that the Marglobe variety is being lauded by both canners and growers, since it is particularly desirable, due to its smooth shape and superior quality.

If the wishes of the waterman of Tilghman, Neavitt, Bozman, Oxford, Cambridge, Crisfield and oyster packters of Knapps Narrows and Black ters of Knapps Narroys and Black Walnut Harbor will be dredged out in the near future. Knapps narrows is a inland cut off into the Choptank from northern bay points.

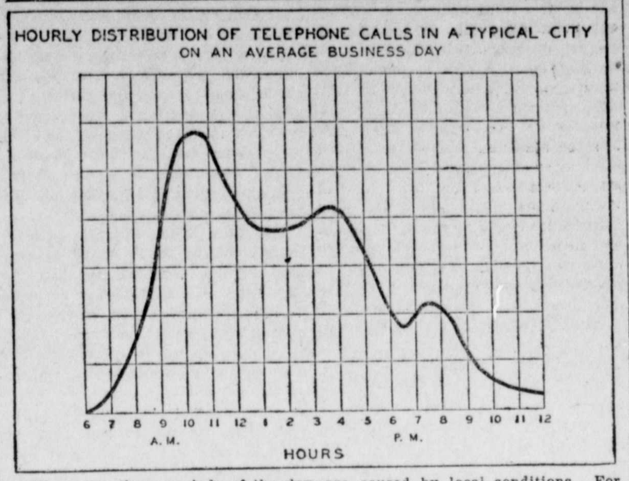

HE DID

Jenkins (reminiscent)—An' old man Jack, all bent up with rheumatism, did Doc Peters finally straighten him out?

Simpson—Yes, he died.

Telephone Calls Reach Peak Three Times In Normal Day

There are three periods of the day when the telephone is used to a greater extent than at any other time. The first calling peak comes in the morning around 10 o'clock, and this is a particularly busy hour in business sections. Then there is another high calling peak in the afternoon about 4 o'clock. The third calling peak comes in the early evening shortly after 7 o'clock, when people are busy making engagements and completing their plans for the next few hours, according to officials of the telephone company.

However, there are exceptions to every rule, and while telephone operators generally have come to feel that the greatest calling peaks in the day are around 10 A. M., 4 P. M. and 7 P. M., telephone engineers realize that they must be prepared for other peaks of traffic.

Some of these increases in the use of the telephone arise out of public events, and holidays, and may be forecast and provided for in advance. Others come suddenly at any time of day or night. Such unexpected peaks are caused by local conditions. For example, a sudden shower may increase telephone traffic by ten to fifteen per cent, for sudden showers occasion sudden changes in plans, and quick communication then becomes necessary. Temporary failure of train service may cause a similar jump in the volume of telephone traffic, although peaks due to these causes usually are of short duration. Extremely hot spells will sometimes increase the traffic on business calls by two or three per cent.

To meet such conditions the telephone company must be prepared at all times with an adequate operating force, but it is a tradition in the Bell System that in times of special stress, where the conditions causing the peak continue for some time, as in the case of blizzards, serious fires or floods or protracted periods of hot weather, operators who are off duty will come voluntarily and offer their services. This has occurred time and time again, and especially in cases of public calamities in which human life and property are at stake.
