

Dutch Guiana ore, I believe is not quite as high in quality as the British Guiana ore.

Q And what would you say as to the extent of those deposits in these two guianas in comparison with the deposits in the United States and other known deposits?

A Considerably larger than the known deposits in the States at the present time.

Q Have you made any study or investigation of bauxite deposits throughout the world in addition to those deposits that you have personally explored or examined in North and South America?

A I personally examined deposits in Mexico - oh, you said North and South America. I personally examined deposits in France, and North Africa. I have studied other deposits of the Mediterranean from published reports and reports of other mining engineers.

Q Will you state how extensive your study on that subject has been?

A It has extended over a period of thirteen years.

Q Are you familiar with the reports made by other mining engineers and the mineralogical literature upon the known bauxite deposits of the world that are presently commercially available for the manufacture of aluminum?

A I have collected practically all of the published literature on the subject -- not necessarily all, but practically all.
