

Q Did you ever know the recoverable amount of bauxite per ton on that ore?

A I said in my opinion the material was not bauxite.

Q Well, whatever it is, then it would not produce aluminum at all?

A It might.

Q All right. How much aluminum per ton would you get out of that material?

A As I recall it, the analysis of that material ran around 72 per cent aluminum oxide.

Q Very well, how much would you get per ton of ore, 72 per cent or what amount?

A I don't believe you could get it out.

Q Well then, not knowing these facts you could not say whether this was commercially available bauxite or not?

A From the analysis it would not indicate it was suitable for making metal.

Q Without knowing these stages of which you are distinctly ignorant, you would not say it was not commercially available would you?

A I do not admit that.

Q You think you could testify as to what is commercially available bauxite without knowing these facts?

A I could testify on deposits I have seen and on deposits I have studied. I have only governmental reports on that
