

Give your Child Dr. King's New Discovery for Coughs and Colds.

Dr. King's New Discovery is a Doctor's Prescription used for over 45 years. It is pleasant and children like it.

You cannot use anything better for your child's cough and cold than Dr. King's New Discovery. It is prepared from Pine Tar mixed with healing and soothing balsams. It does not contain anything harmful and is slightly laxative, just enough to expel the poisons from the system. Dr. King's New Discovery is antiseptic—kills the cold germs—raises the phlegm—loosens the cough and soothes the irritation.

"I have used Dr. King's New Discovery for the past three years and use it continually in my family. My children are very fond of it for it keeps them *free* from cold. I can't say too much for it, and take pleasure in recommending it to my friends." *Mrs. A. S. Haines, Franconia, N. H.*

Don't put off treatment. Coughs and colds often lead to a chronic cough, pneumonia and other serious lung troubles. It is also good for adults and the aged. Get a bottle to-day. All druggists.

WHY THE FARMER NEEDS RURAL CREDIT

How He Could Secure the Capital Needed For Investment In Farm Property and In Permanent Improvements.

F. B. BOMBERGER,
Maryland Agricultural College Extension Service.

In the old days when the American farmer produced for a local market and bought in a local market, under conditions determined largely by local needs, when crops were staple and methods of production were standardized, there was little need for extended credit. Each crop paid the way for the next, and store credit was sufficient for his needs. Nowadays this is all changed. The commercial farmer of today produces his crops under conditions that are affected by world-wide influences. He sells in a market that is fixed by national and international conditions and he buys under conditions similarly fixed. Further, the old, careless, slipshod methods of production are no longer efficient. The impoverished land demands more intensive cultivation, drainage, fertilizers, more live stock and more labor. All of these call for more capital; and the question is, where shall he get it?

Why not from the banks? it may be asked. The answer is that our whole banking system has been created and organized to meet the needs of commerce, trade and manufacturing industry, and is not suited to the requirements of the farmer.

To carry on his business effectively the farmer must have two distinct types of credit, neither of which is adequately provided by our present banking system: first, long term credit, by means of which he may secure capital to buy his land or to make permanent improvements; second, short time credit which will supply him with capital for the purchase of seeds, fertilizers, machinery, live stock, labor, etc. He needs long time credit because the returns from one or two or five years' crops cannot be expected to repay capital invested in the form of permanent improvements. He needs short time credits because crops do not mature within the limited credit periods customarily allowed by our commercial banks. The farmers of European countries are provided with two distinct types of credit agencies which are especially designed to meet these needs. The one is the Land Mortgage Association, which enables him to issue and sell bonds, running for long periods of years, bearing a low rate of interest and secured by the value of his land. The other provides a special form of personal credit not limited to thirty, sixty or ninety days or even six months, but extending from six months to three years. These are the Rural Credit Banks which play so important a part in the development of efficiency in European agriculture.

These two types of institutions, in some form, should be placed at the disposal of American agriculture; for until the American farmer is permitted to mobilize his assets and his credit as fully and as freely as does the merchant, the manufacturer or the industrial corporation, his productive capacity must necessarily be limited and the progress of the industry is bound to be retarded.

UNIFORMITY DESIRABLE IN SELECTING EXHIBITION CORN.

In selecting ten ears for exhibition the first thing to remember is that the sample will be judged as a whole and not in part on the merits of a few exceptionally good ears. Two or three unusually fine ears cannot make up for the deficiency of the rest of the sample. They will bring out more prominently the poor qualities of the other ears and therefore detract from, rather than add to, the appearance of the sample.

Uniformity should be one of the principal considerations in selecting corn for exhibition. Have every ear like every other ear in shape, size, character of kernel, color of cob and in shade of color of the grain. When selecting sample, first pick out in the field while husking or from the wagon or crib, one hundred or more of the best ears to be found. Lay them out on a table or floor side by side, and having in mind all the characters of a good ear, study each carefully and eliminate the poorest ones. Two or three hours can be spent very profitably at this. Next, select two or three of the most ideal ears in the pile, using each as a standard, match them with as many good ears as can be found. Finally, out of these lots, choose the best ten ears that will match.

The ear should be cylindrical, or at least only slightly tapering, with rows running straight from butt to tip. A tapering ear has either less rows on one end than on the other, or the kernels are shorter or narrower on the tip end. In either case, the yield of grain is less than that of a cylindrical ear; besides, in the latter case, there is the additional objection of lack of uniformity in shape of kernel which makes it impossible for the planter to drop them evenly.—Nickolas Schmitz, Maryland Agricultural Experiment Station.
