TELEPHONES UNDERGO HARD SERVICE TEST

Engineer Testing Telephone Transmitters

The telephone lives a hard life. Even before it becomes a part of the nation's best known communication system each instrument has to undergo innumerable tests. The engineers in the department of development and research in the Bell Telephone Laboratories, New York, want to know that each of the 200 parts function properly and will give a dependable and satisfactory service to the telephone user.

One of the ways that the transmitter—that part of the telephone instrument into which the voice is spoken so that it is carried to the distant point clearly and distinctly—is tested, is to give it what the engineers call the "life test." In making this test hundreds of transmitters are mounted on specially constructed racks where the instruments undergo many hard knocks.

During the process of making the test the engineers attempt to put this piece of apparatus through every action that it will have to face when it is attached to one's telephone. Realizing that many impatient users of the telephone sometimes slam the receiver on the hook when they are through talking, the engineers in their research and development work simulate the jar that would come from this action. An electro magnet plunger operated at intervals so that the supporting rack is banged and shaken, giving the instruments the same kind of a jar that they would get when the receiver is banged up impatiently.

One may ask, "Why is it necessary to go to all of this trouble?" But the engineers do not consider it trouble, this is just one of the many experiments that are carried on to make better transmitters. And better transmitters, of course, mean better telephone service. Users can be understood more easily by the people to whom they talk and everyone is better satisfied, since science has taken a hand in improving telephone apparatus.

LARGEST EXPORT ORDER

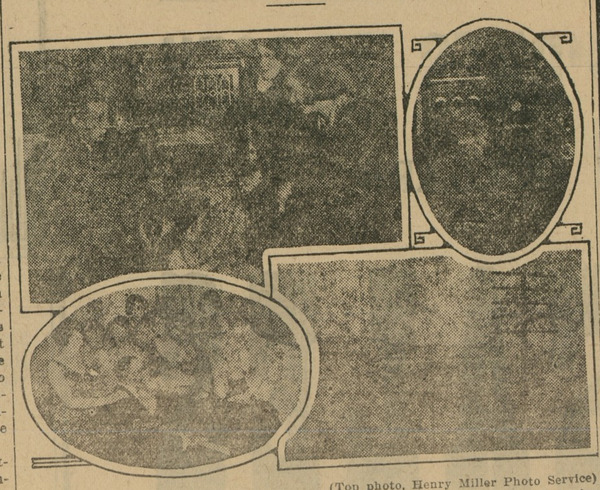

The other day the largest export order for motor cars ever placed by telephone was consumated by an automobile company located at South Bend, Ind. Seated at his desk, the Vice-President of the company talked over the new transatlantic raido telephone with London and arranged for the delivery of 1,000 cars. This represented nearly $1,500,000 worth of business.

Supplies in Camel's Hump

The humps on the back of a camel are stores of flesh and fat, re-absorbed in support of the animal when overtaken by a famine.

IN THIS RADIO AGE, WIRE IS NECESSARY TO OPERATION OF COMMUNICATION SYSTEMS

Now More Than 50,000,000 Miles of Wire Connect the 17,500,000 Telephones of the Bell System. About 6,500,000 Miles of Copper Wire Expected to be Used This Year

(Top photo, Henry Miller Photo Service)

Listening to Roxy and his gang over the radio is a popular pastime for fans in every section of the country. The stations broadcasting chain programs are dependent on telephone lines for such features.

Wireless and radio accomplishments are so featured in the day's news that many people have the idea that it will be only a matter of time when there will be no need for wires in the communication field; that all messages will soon be transmitted via wireless, overlooking the fact entirely that even radio programs, transatlantic radio telephone conversations and the transmission of pictures by radio are all dependent on the use of wire.

From every microphone, telephone or picture transmitting station, wires are necessary to the operation of the apparatus. In fact without wires there could be no broadcasting, no transatlantic telephone, and no transmission of radio pictures.

When broadcasting stations from coast-to-coast and lakes to gulf are on the air with a nation-wide program the stations are tied together by wires. Such features would not be possible without the use of wires and in this way telephone lines play an important part in present day achievements, even though they are much in the background.

Wire is still a very neecssary part of the world's communication system. In the Bell System alone there are more than 50,000,000 miles of wire connecting over 17,500,000 telephones. The manufacturer of this very important part of telephone plant is one of the major jobs of the Hawthorne works of the Western Electric Company, where the greater part of the telephone apparatus used in this country is turned out.

Telephone companies are among the largest users of copper in the world. Most of this copper goes into wire. It is estimated that the Bell System will use about 6,500,000 miles of copper wire to meet the requirements for exchange and toll telephone growth this year. This does not include the requirements for apparatus.

The largest telephone line wire used is about one-sixth of an inch in diameter and the finest magnet wire is about the size of a human hair, but the system requires large amounts of practically all sizes. The problem of having so many sizes readily available in adequate amounts for routine work, as well as for emergencies, has been greatly simplified by a rod rolling and wire drawing mill for copper, recently set in operation at the Hawthorne plant. The annual output of the mill is about 42,000,000 pounds of all sizes of telephone wire.

Looking Ahead

A little boy, some time after he had been put to bed, called to his mother and said: "Oh, mummy, I don't feel so very well. I'm sure I sha'n't be able to eat any breakfast tomorrow, so can I have a piece of bread and jam now?"

Economic "Rebellion"

On January 25, 1787, the United States arsenal at Springfield, Mass., was attacked by the "rebels" in Shap's rebellion. This rebellion was a sequel to the Revolution, and was brought on by dissatisfaction with the unstable economic conditions.

One of World's Wonders

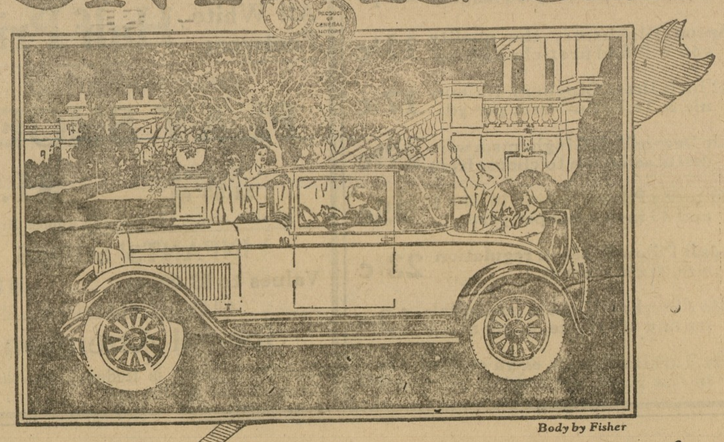

The hanging gardens of Babylon consisted of trees and flowers apparently planted upon the roof of some building. The structure was one square terrace built upon another to about 150 feet in height and resting upon hollow pillars of burnt brick which were filled with earth. For irrigation, water had to be pumped up from the Euphrates river.

Bat's Handicap

The bat catches its food during the twilight for the reason that it cannot see clearly either in broad daylight or complete darkness.

The New and Finer

PONTIAC SIX

Body by Fisher

Smartness and style you cannot resist at a price that cannot be matched

$835
SPORT CABRIOLET
(4-passenger)

Sedan	$775
Coupe	775
Sport Roadster (4-pass.)	775
Landau Sedan	895
De Luxe Landau Sedan	975
De Luxe Delivery Chassis	585
De Luxe Screen Delivery	760
De Luxe Panel Delivery	770

Oakland Six, $1025 to $1295. All prices at factory. Delivered prices include minimum handling charges. Easy to pay on the liberal General Motors Time Payment Plan.

This is the six-cylinder Sport Cabriolet that has taken the nation by storm. But there's nothing strange in that. Its vivid beauty places it in the very front rank of America's smartest cars. And its famous six-cylinder engine provides all the spirit and dash and stamina that such a swanky type requires.

Spanish leather upholstery inside the cab and in the spacious rumble seat as well. Appointments that are unobtrusively rich. And a truly arresting color scheme—Brevoort Green fenders, top and quarters; Cherokee Gray Duco on body and hood; orange striping for brilliant contrast.

Never in any low-priced six has the appeal of the intimate closed car type been so admirably expressed! Never has any six of the type provided such commanding value! For here are all the basic advantages of Pontiac quality, endurance and economy, *plus* a smartness and style you cannot resist at a price that cannot be matched.
