LITTER CONTEST ON — KENT'S THREE ENTRIES SEEK COMPETITION

The 150 day, 1500 pound Litter Contest is on. Three progressive Kent county farmers have entered litters of nine pigs each.

This contest is an inspiring competition as well as a means of demonstrating the economy of well bred swine, sanitation, pasture crops and full feeding of a balanced ration (providing mineral matter and protein to supplement the fattening carbahydrate feeds such as corn, wheat or barley) and adequate supply of water drinking water. Liberal prizes are offered to stimulate interest. The friendly competition among the growers stimulate also. The net result is better hogs at less price per pound and much satisfaction. If a prize is won that is so much "velvet."

This contest has been very influential in moulding hog feeding practices along approval lines. It is especially timely this year when quality of economy in cost of production are doubly important. Any Kent Countian with well bred litter of nine or more pigs, who desires to uphold the honor of his county and his community against any other county and community in the State, and who is willing to practice the tried methods of feeding and management, is urged to enter the contest which is fostered by the Maryland Stockmen's Association and the Extension Service. The County Agent has entry blanks and details. Let's go!

FIT SEED BEDS CAREFULLY

Proper fitting of the seed bed for crops is always important. In seasons like the present when soils are unusually loose and when the moisture content is limited and uncertain (rain fall in 1931 may be short of normal) it is doubly important to fit the seed bed with care.

On some light land deep plowing this late will loosen the soil too much making implement such as a cultipacker will aid greatly in fitting the seed bed. Heavy rains are a great aid in packing seed beds. As a means of making a fine seed bed—the use of a disc harrow immediately after plowing will be found most valuable Harrow over the land plowed during the day before leaving the field at night if you cannot follow the plow more closely with a harrow.

After crops like corn, soybeans, etc., are in the ground and germinated, the use of a weeder or rotary hoe is very helpful in controlling weeds and in conserving moisture. Row crops may be worked two or three times in this manner and even when plants are several inches high little damage will be done if the work is done during the middle of the day. Too early or two late working when the plants are full of moisture makes them brittle and liable to snap off.
