

There are other portions of the
teeth found - but left characteristic the
the formation on - the base a
of mould of the entire jaw of Dr P. - This
would tell them the peculiarity of Dr P
said - so peculiar that nothing like it
can be found elsewhere. - It will
appear that these teeth must have
been cast into the furnace in
connection with the head

Also the bones of the upper jaw
jaw - & this will correspond with the
mould of the jaw as taken by Dr R.

The thorax exhibits a perforation
which will be testified of to them that
it was made by a wound -

On the human chemical applications
had been applied - potash.

Will show that the human was not
that of any subject at the College.

The remains were deposited by
some person having access among
anatomical skulls.
