

I saw nothing in the Human's Affidavit to which I knew of Dr P. Hume - Any material subject -

The flask then indication of application of chemical agents - i.e. strong solution of Potash
{ Identifies deposit - or report - to Coroner
{ I saw it in same in hand - 9.1.1.
{ vide, supra - as to performance below
{ 6th & 7th files.

I have taken possession of the articles left by Dr Hunter Gay. I found them in the papers in which I delivered them to Dr Gay - that is the blood rights - I delivered them to Mr. Crosby, a Skilful Chemist and my employer & works with me - to complete his examination.

I proved by basic chemical tests that the application was Potash - The effect of it is to decompose bodies; when heat is applied does it very rapidly.

Now we will say how To decompose body I would decompose the Potash & boil the body in it -

Can say how long a body could be decomposed - if cut up in pieces & boiled it would decompose in a few hours. I should think it would take full half the weight of the body of Potash to decompose it - it would take large kettle it all down at once - I should think so & might even be killed.
